

Deep Neural Networks

Convolutional Networks III

Bhiksha Raj

Spring 2020

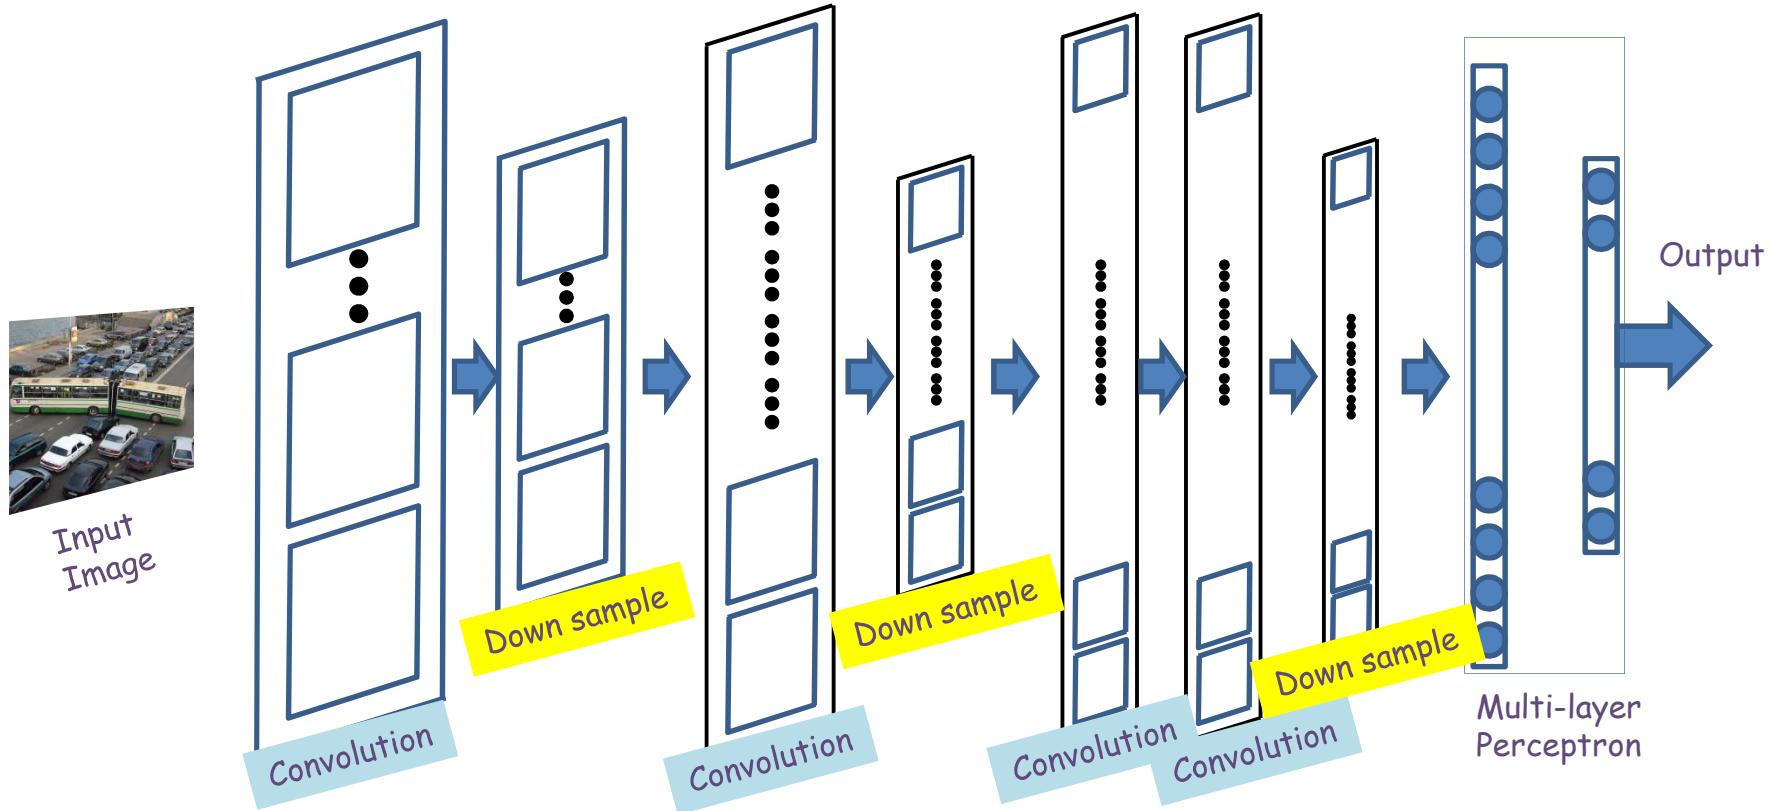

Outline

- Quick recap
- Back propagation through a CNN
- Modifications: Scaling, rotation and deformation invariance
- Segmentation and localization
- Some success stories
- Some advanced architectures
 - Resnet
 - Densenet
 - Transformers and self similarity

Story so far

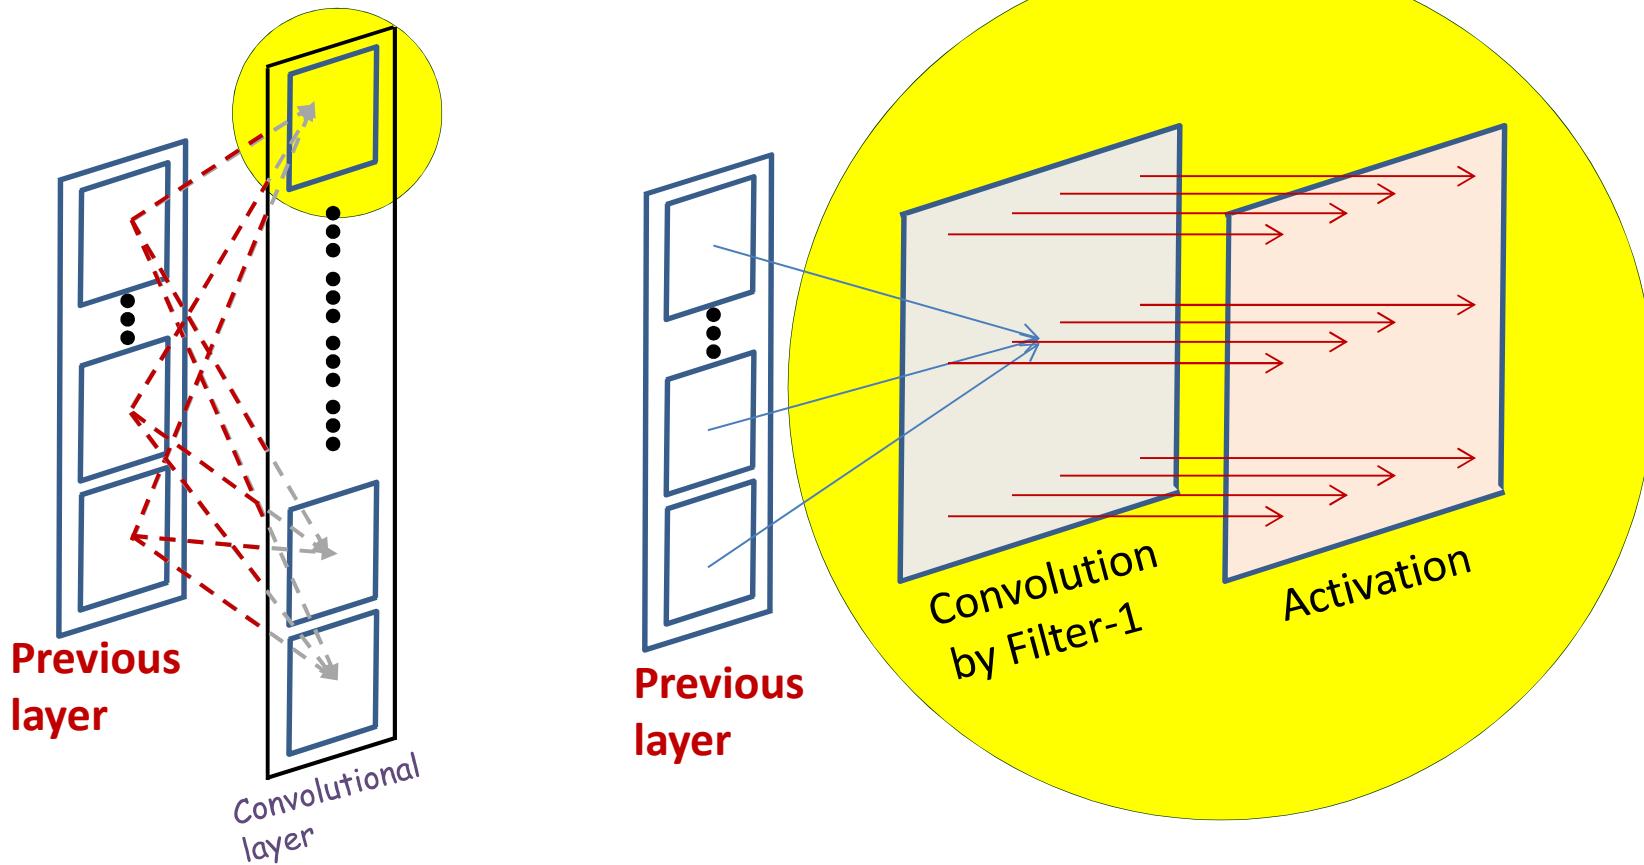

- Pattern classification tasks such as “does this picture contain a cat”, or “does this recording include HELLO” are best performed by scanning for the target pattern
- Scanning an input with a network and combining the outcomes is equivalent to scanning with individual neurons hierarchically
 - First level neurons scan the input
 - Higher-level neurons scan the “maps” formed by lower-level neurons
 - A final “decision” unit or layer makes the final decision
 - Deformations in the input can be handled by “pooling”
- For 2-D (or higher-dimensional) scans, the structure is called a convnet
- For 1-D scan along time, it is called a Time-delay neural network

The general architecture of a convolutional neural network

- A convolutional neural network comprises of “convolutional” and optional “downsampling” layers
- Followed by an MLP with one or more layers

A convolutional layer

- Each activation map in the convolutional layer has two components
 - A *linear* map, obtained by (joint) **convolution** over maps in the previous layer
 - Each linear map has, associated with it, a **learnable filter**
 - An **activation** that operates on the output of the convolution

What is a convolution

0
1 0 1
0 1 0
1 0 1

bias

Filter

1	1	1	0	0
1 <small>$\times 1$</small>	0 <small>$\times 0$</small>	1 <small>$\times 1$</small>	0 <small>$\times 1$</small>	0 <small>$\times 0$</small>
0 <small>$\times 0$</small>	1	1 <small>$\times 0$</small>	1	0
0 <small>$\times 1$</small>	0 <small>$\times 0$</small>	1 <small>$\times 1$</small>	1	1
0	0	1	1	0
0	1	1	0	0

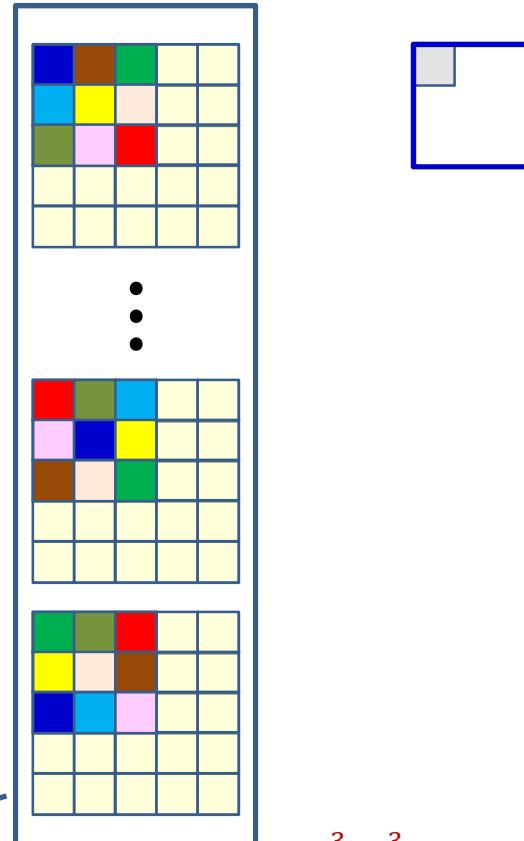

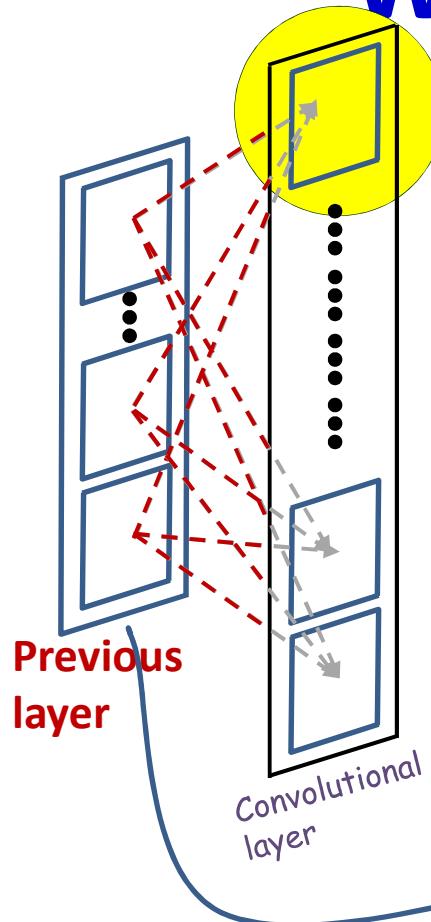

Input Map

4		

Convolved Feature

- Scanning an image with a “filter”
 - At each location, the “filter and the underlying map values are multiplied component wise, and the products are added along with the bias

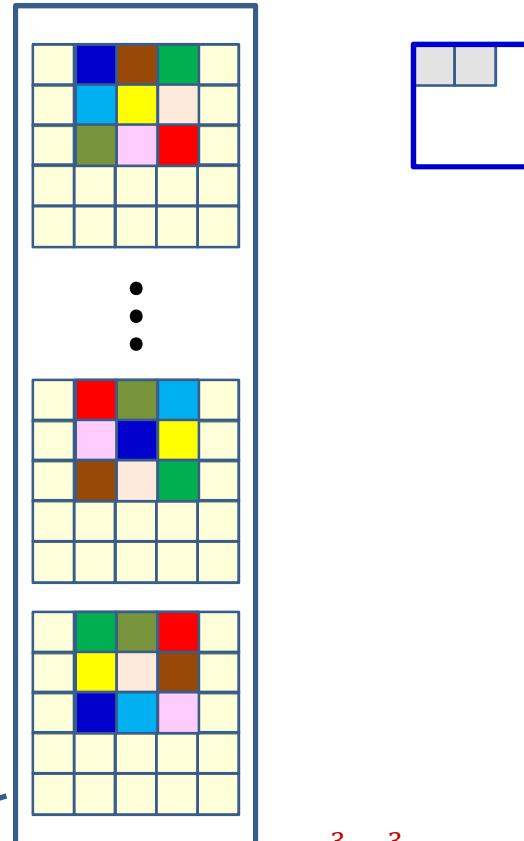

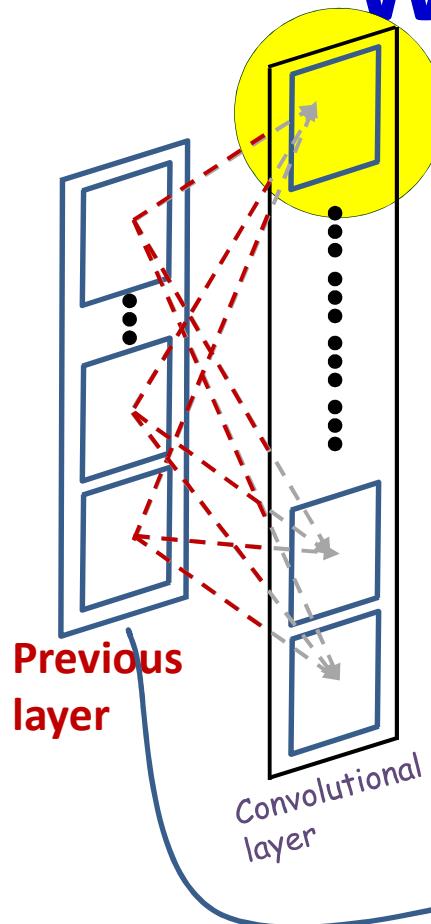

What really happens

$$z(1, i, j) = \sum_m \sum_{k=1}^3 \sum_{l=1}^3 w(1, m, k, l) I(m, i + l - 1, j + k - 1) + b$$

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

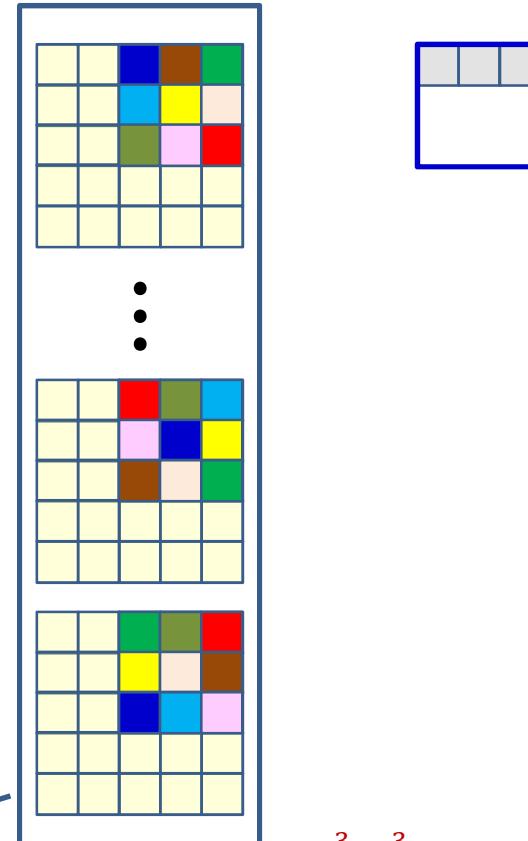

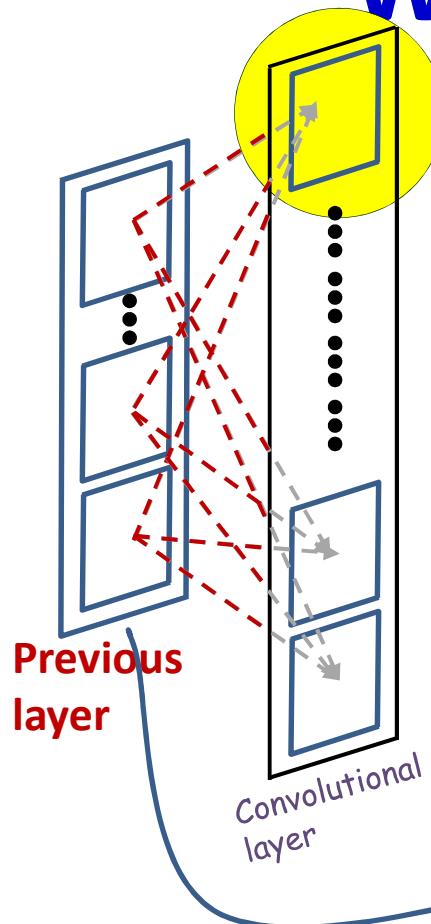

What really happens

$$z(1, i, j) = \sum_m \sum_{k=1}^3 \sum_{l=1}^3 w(1, m, k, l) I(m, i + l - 1, j + k - 1) + b$$

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

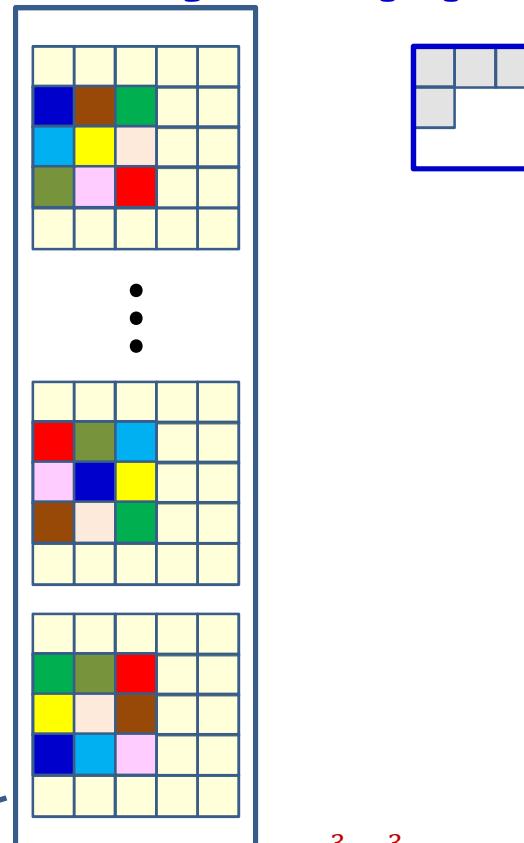

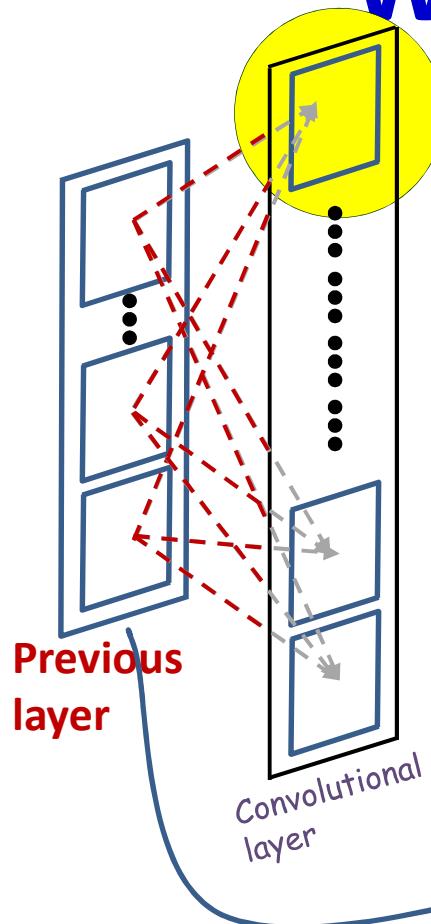

What really happens

$$z(1, i, j) = \sum_m \sum_{k=1}^3 \sum_{l=1}^3 w(1, m, k, l) I(m, i + l - 1, j + k - 1) + b$$

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

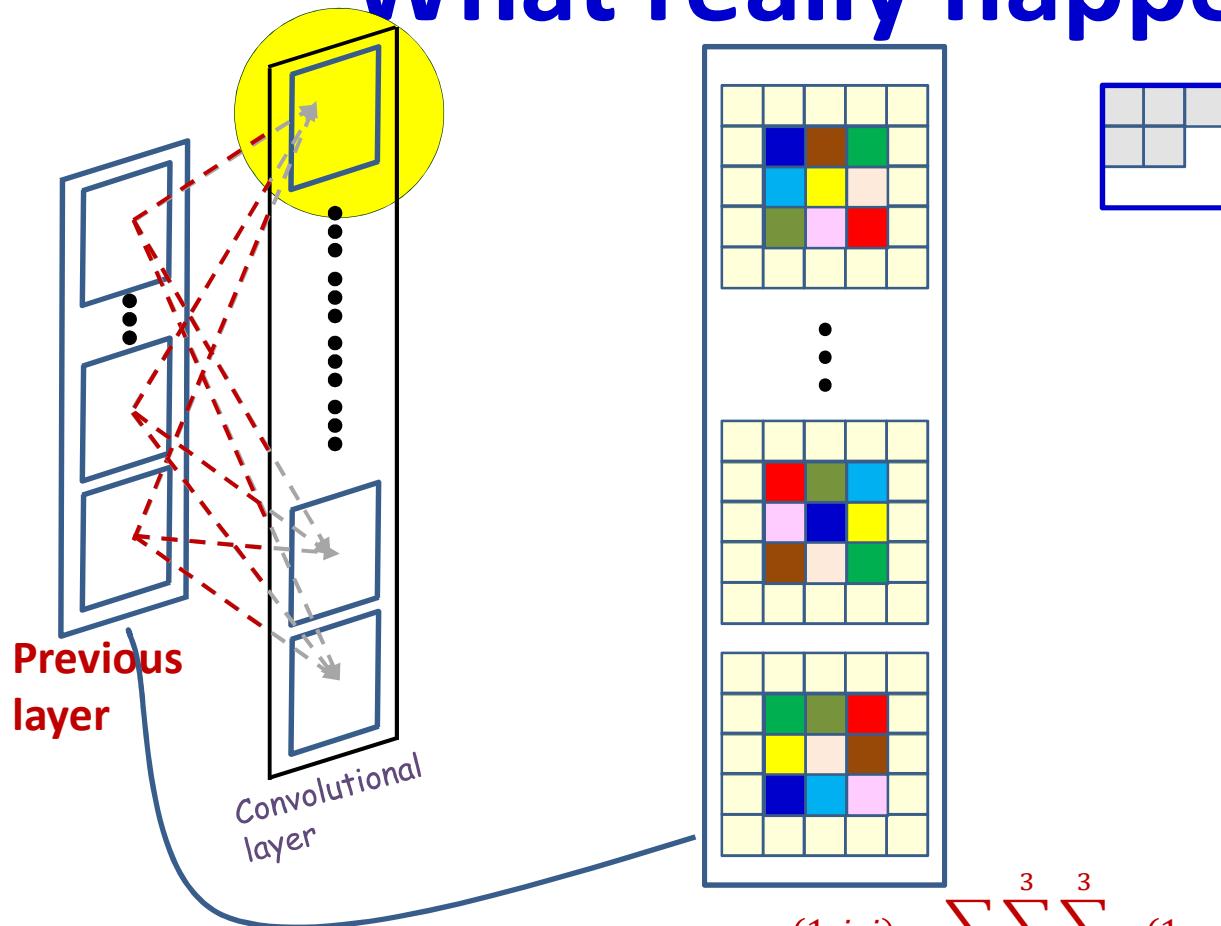

What really happens

$$z(1, i, j) = \sum_m \sum_{k=1}^3 \sum_{l=1}^3 w(1, m, k, l) I(m, i + l - 1, j + k - 1) + b$$

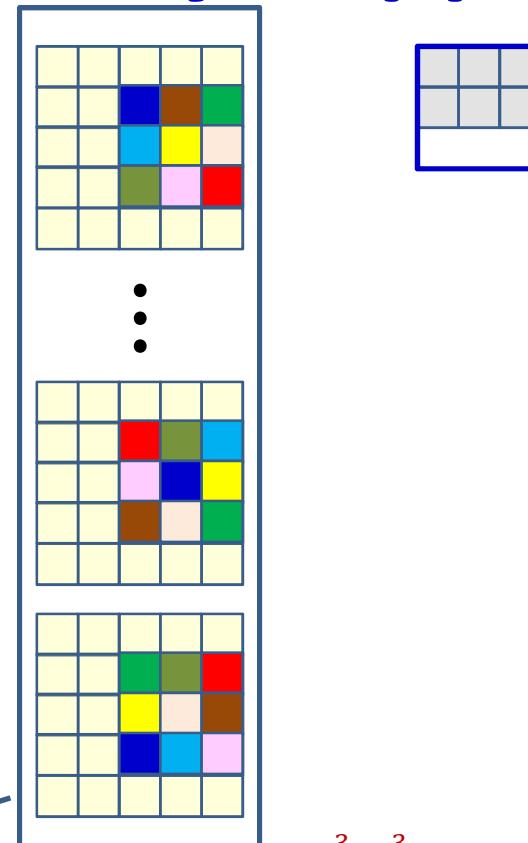

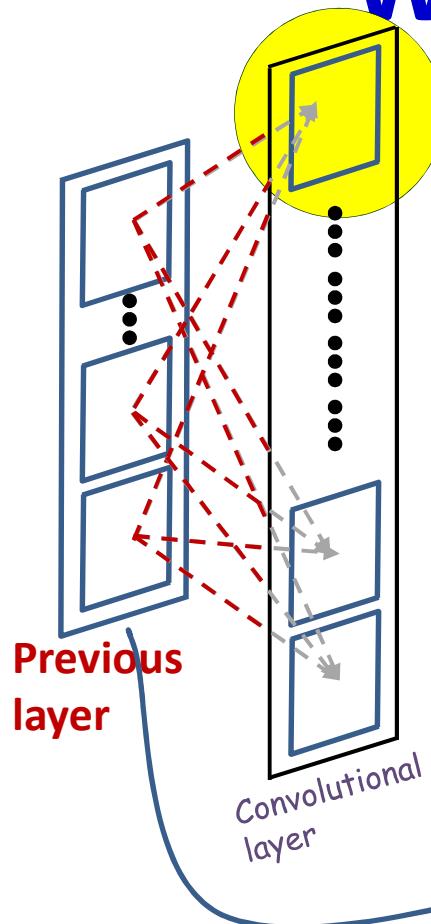

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

What really happens

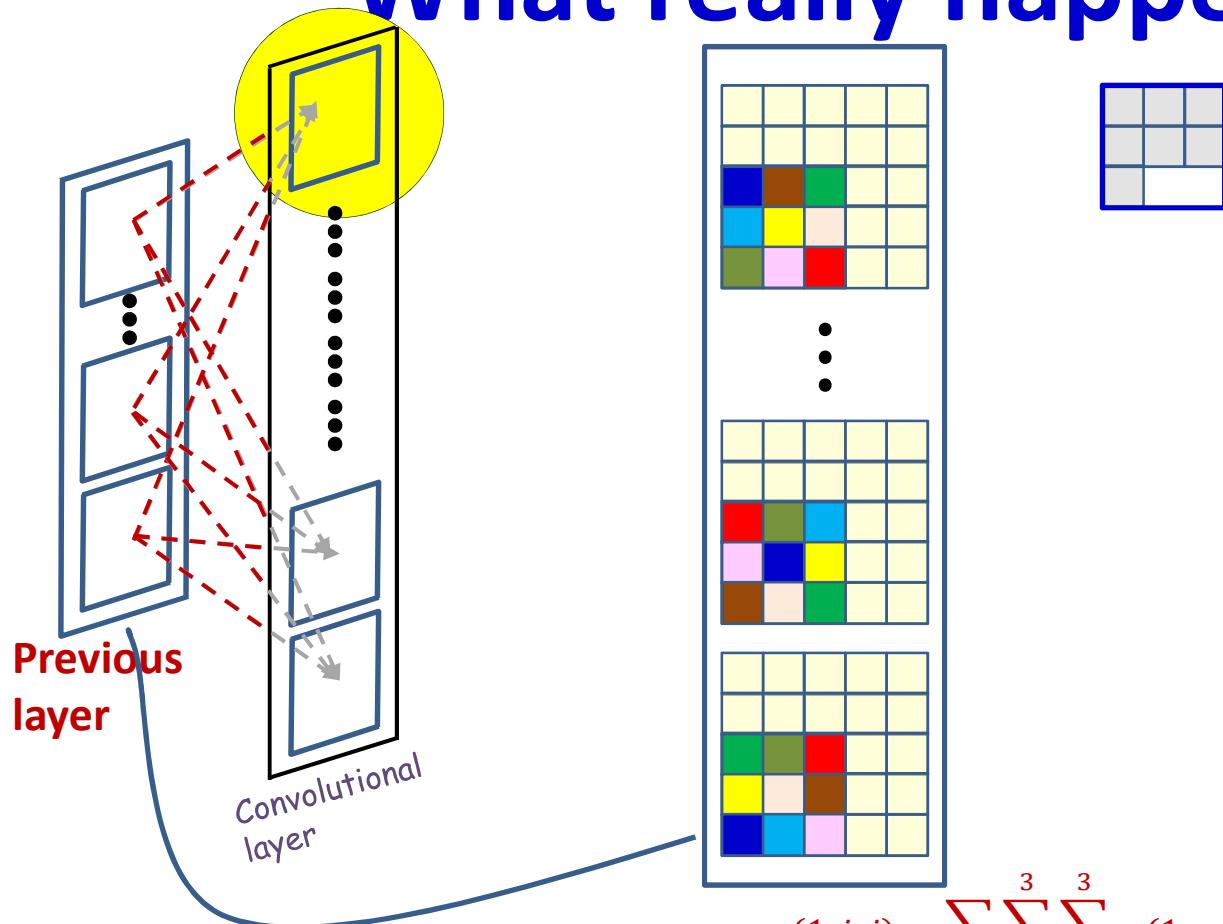

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

What really happens

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

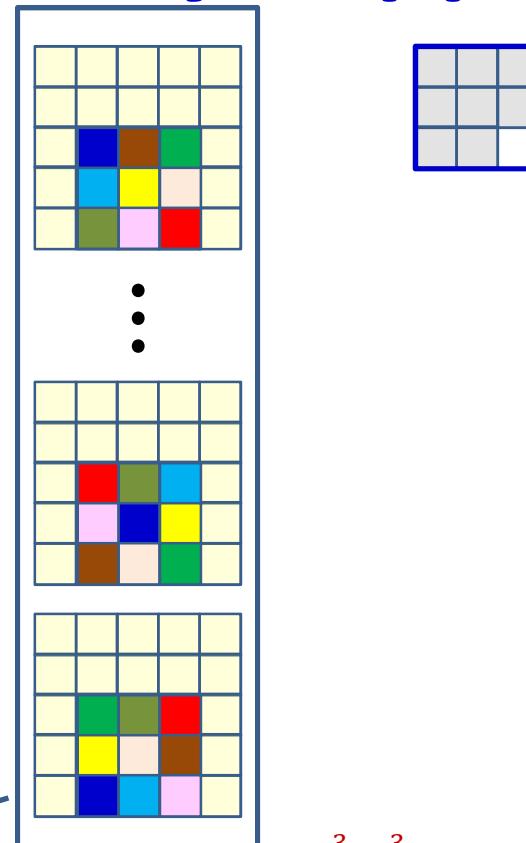

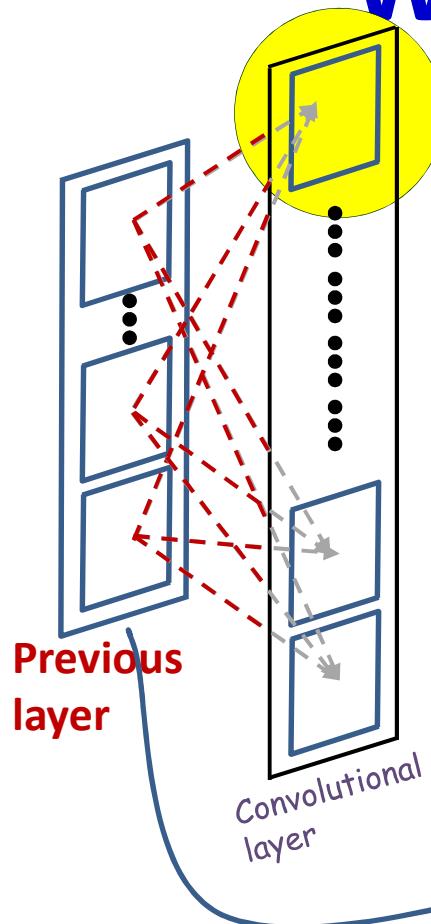

What really happens

$$z(1, i, j) = \sum_m \sum_{k=1}^3 \sum_{l=1}^3 w(1, m, k, l) I(m, i + l - 1, j + k - 1) + b$$

- Each output is computed from multiple maps simultaneously

What really happens

$$z(1, i, j) = \sum_m \sum_{k=1}^3 \sum_{l=1}^3 w(1, m, k, l) I(m, i + l - 1, j + k - 1) + b$$

- Each output is computed from multiple maps simultaneously
- There are as many weights (for each output map) as
size of the filter x *no. of maps in previous layer*

A better representation

Filter applied to kth layer of maps
(convulsive component plus bias)

- ..A *stacked arrangement* of planes
- We can view the joint processing of the various maps as processing the stack using a three-dimensional filter

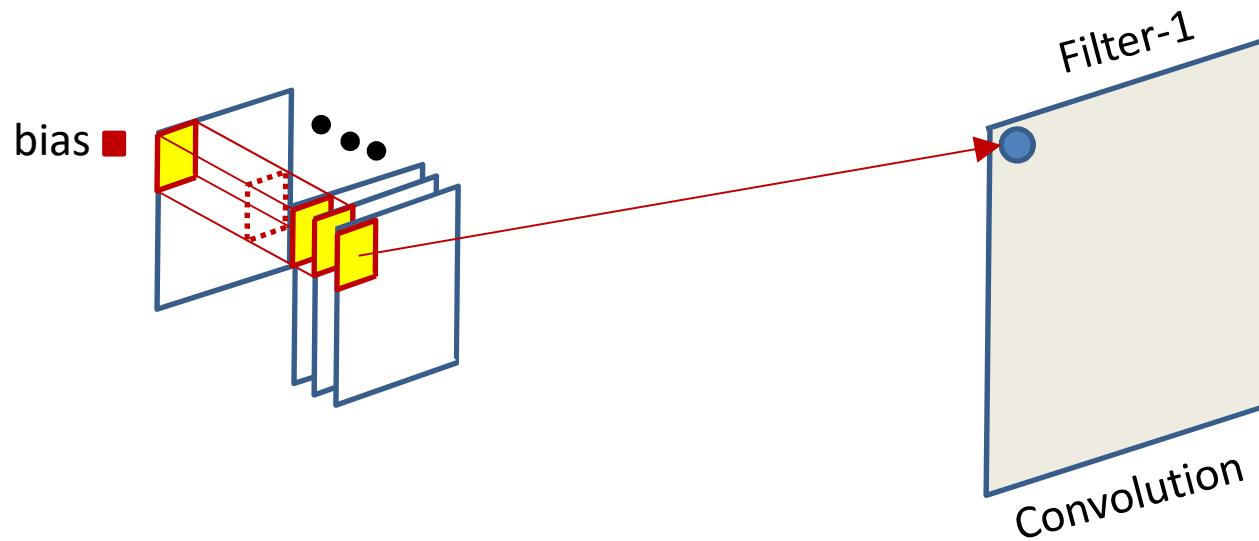

A better representation

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

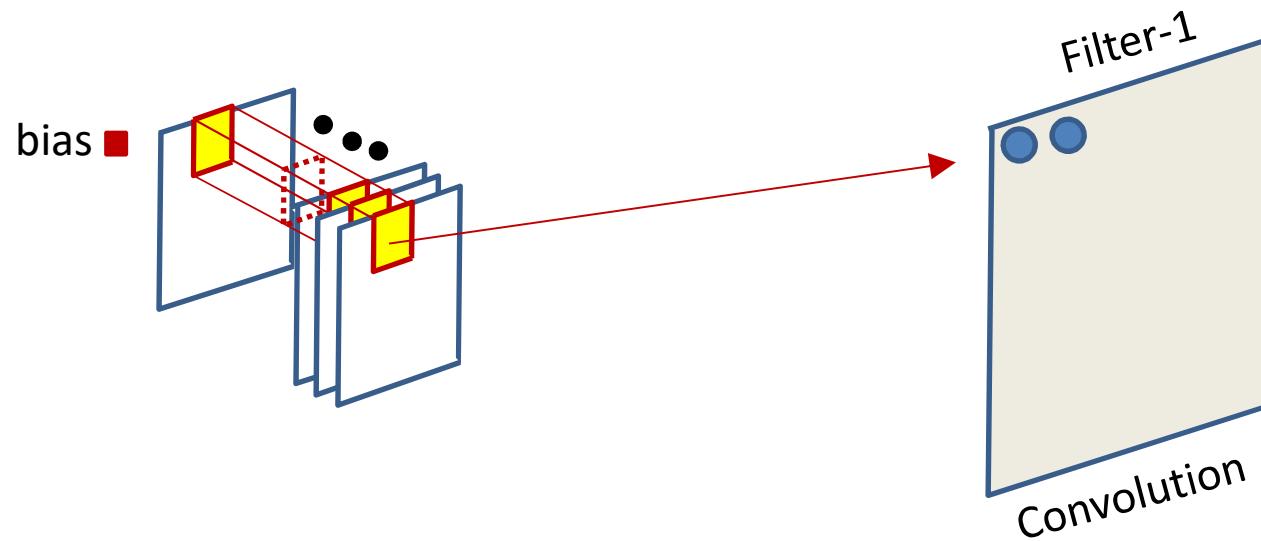

A better representation

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

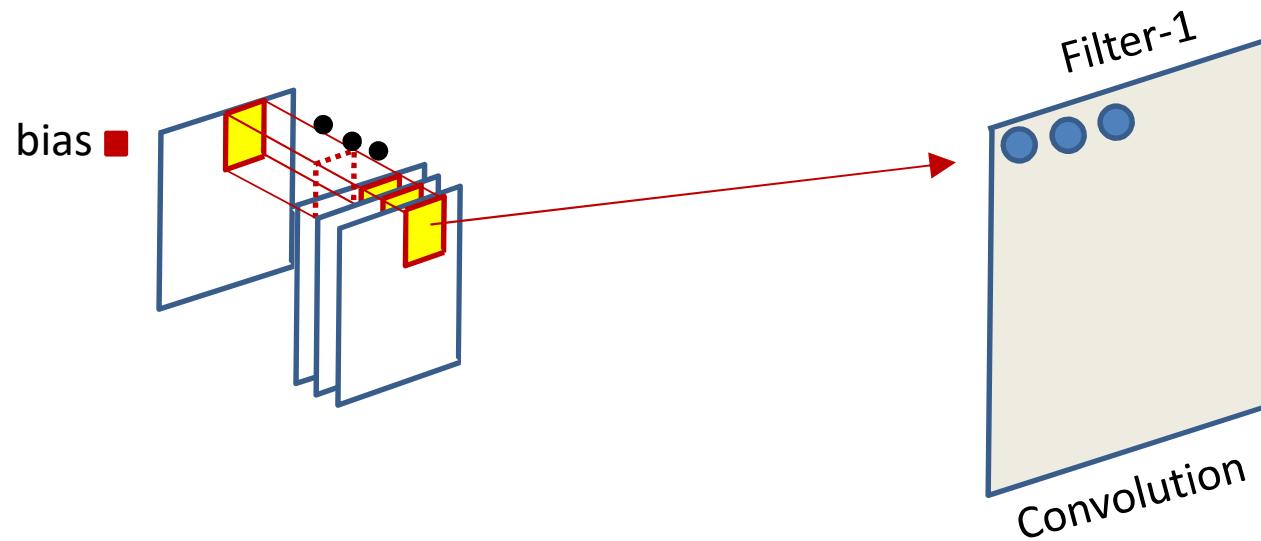

A better representation

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

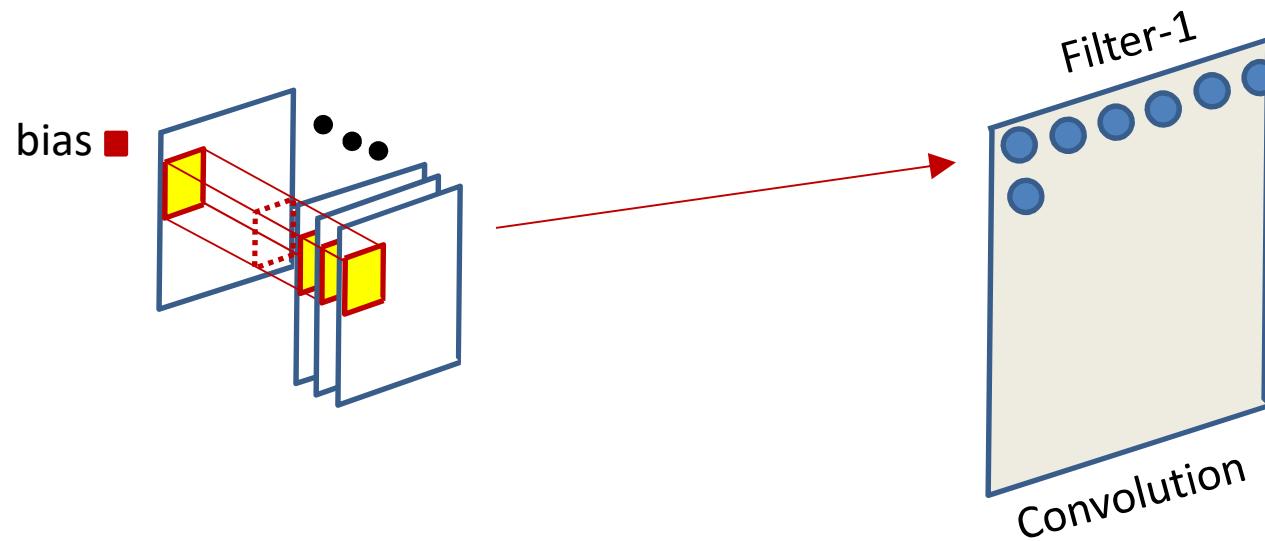

A better representation

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

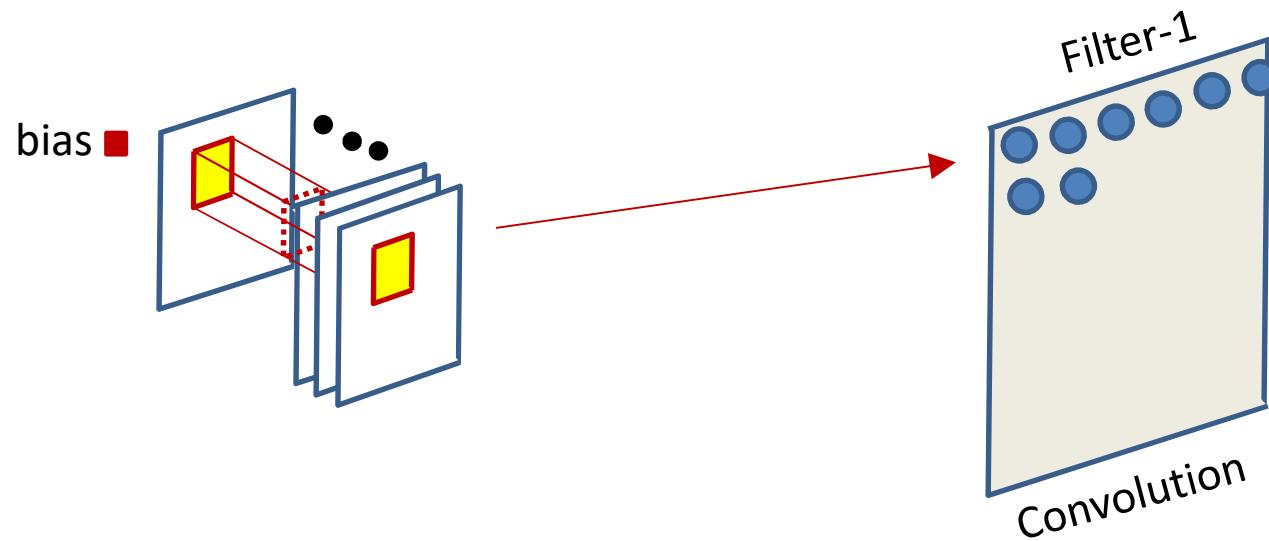

A better representation

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

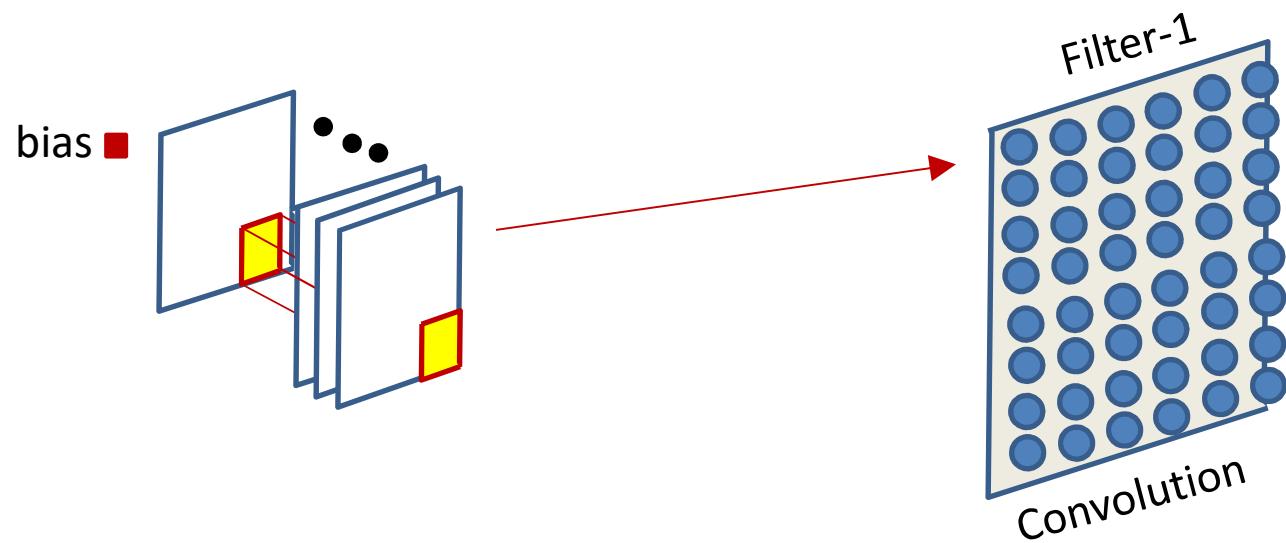

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

A better representation

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

$$z(s, i, j) = \sum_p \sum_{k=1}^L \sum_{l=1}^L w(s, p, k, l) Y(p, i + l - 1, j + k - 1) + b(s)$$

- The computation of the convolutive map at any location *sums* the convolutive outputs *at all planes*

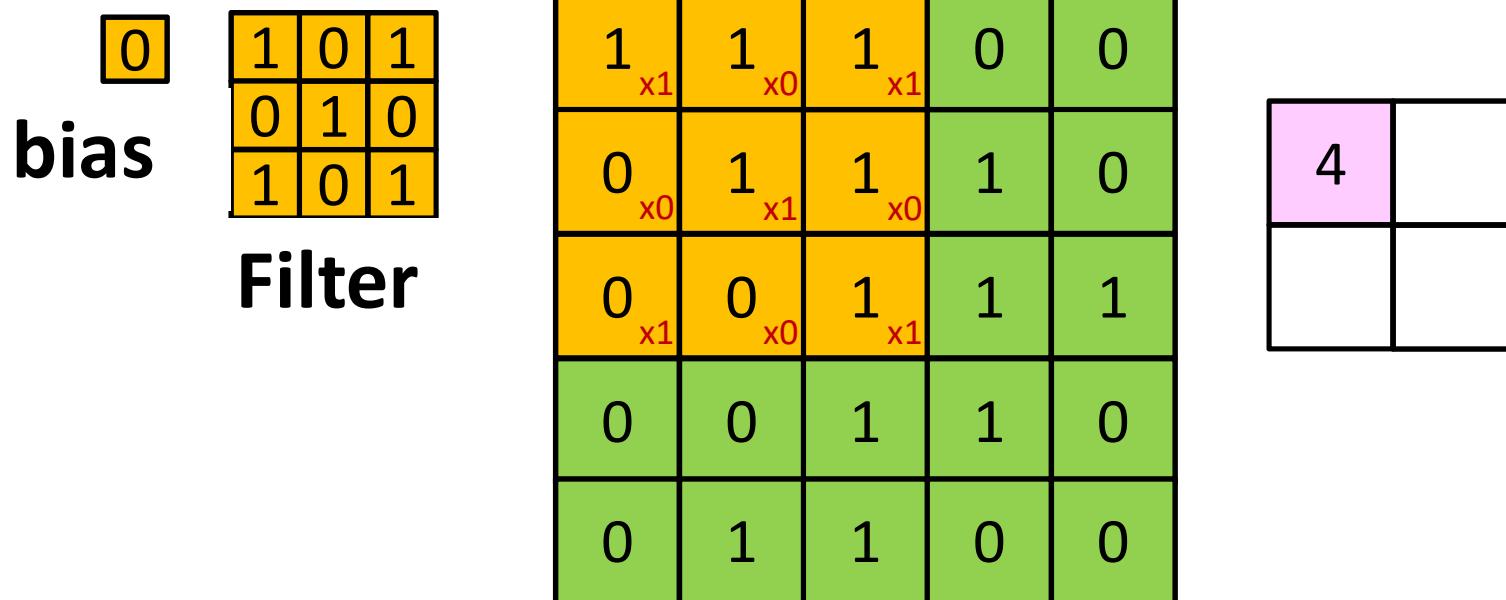

Convolutional neural net: Vector notation

The weight $\mathbf{w}(l, j)$ is a 3D $D_{l-1} \times K_l \times K_l$ tensor

$\mathbf{Y}(0) = \text{Image}$

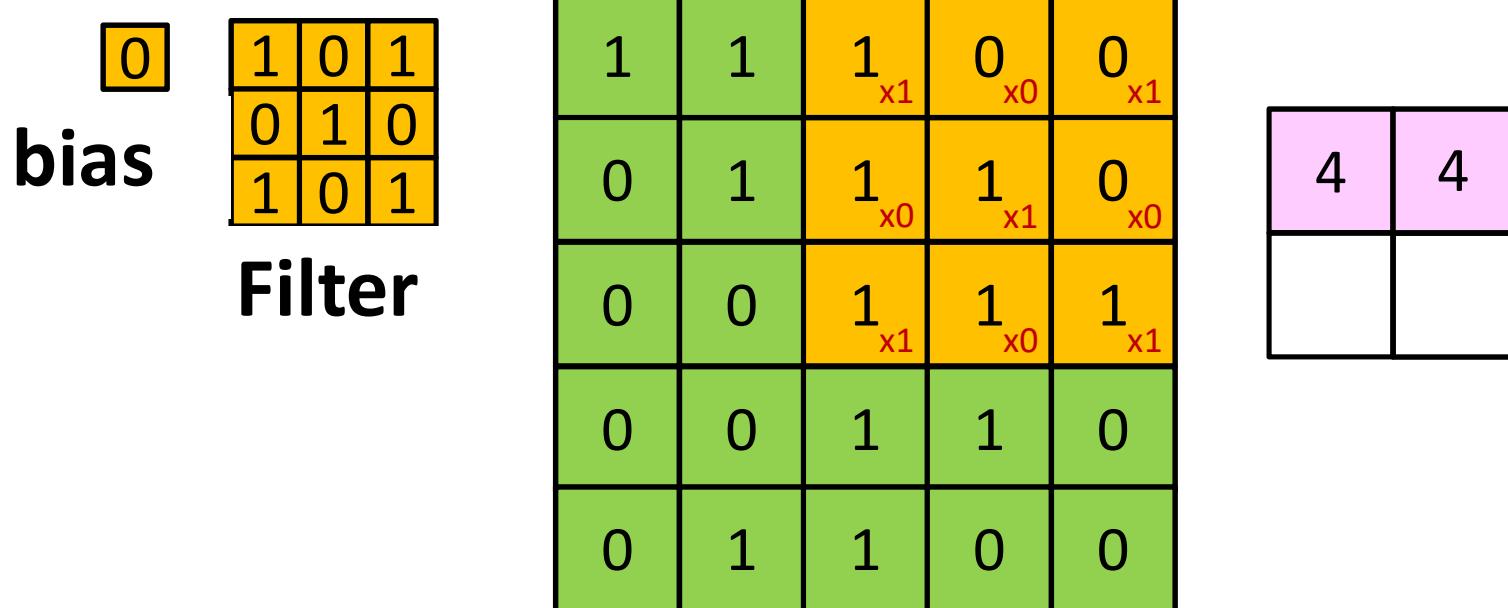

```
for l = 1:L  # layers operate on vector at (x,y)
    for j = 1:D_l
        for x = 1:W_{l-1}-K_l+1
            for y = 1:H_{l-1}-K_l+1
                segment = Y(l-1, :, x:x+K_l-1, y:y+K_l-1) #3D tensor
                z(l, j, x, y) = w(l, j).segment #tensor inner prod.
                Y(l, j, x, y) = activation(z(l, j, x, y))
Y = softmax( {Y(L, :, :, :)} )
```

Convolution can *shrink* a map by using strides greater than 1

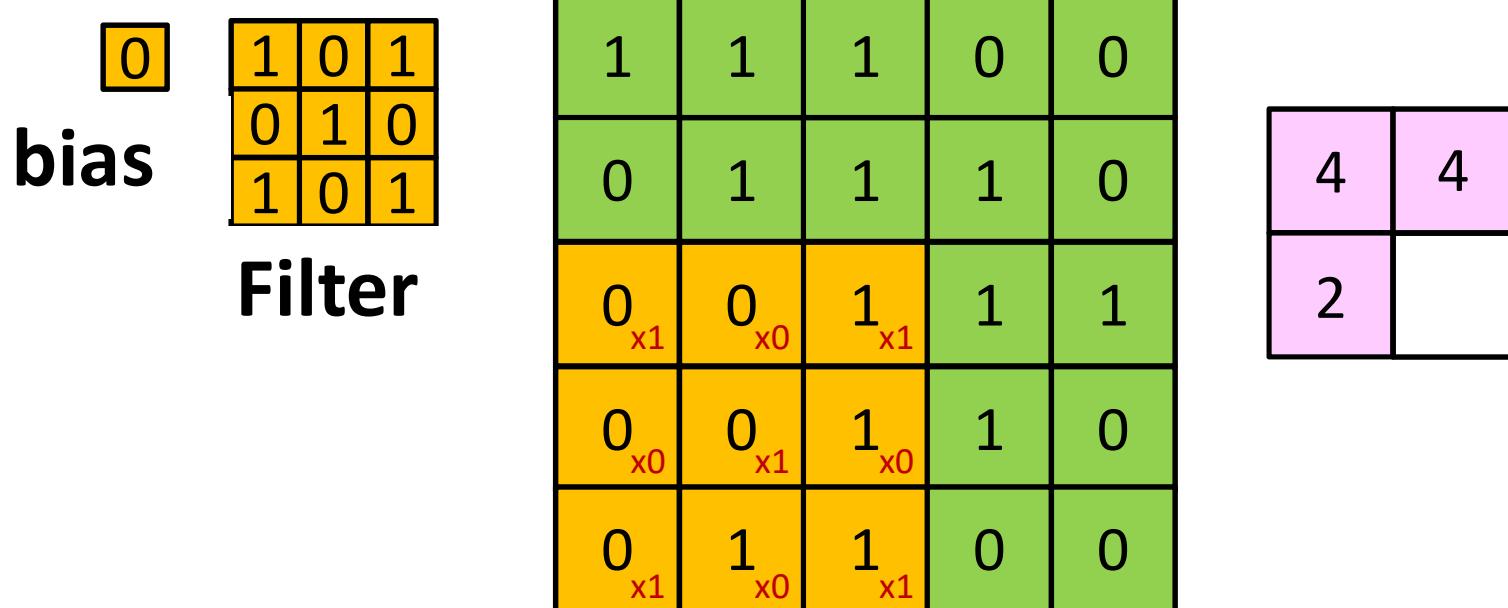

- Scanning an image with a “filter”
 - The filter may proceed by *more* than 1 pixel at a time
 - E.g. with a “stride” of two pixels per shift

Convolution can *shrink* a map by using strides greater than 1

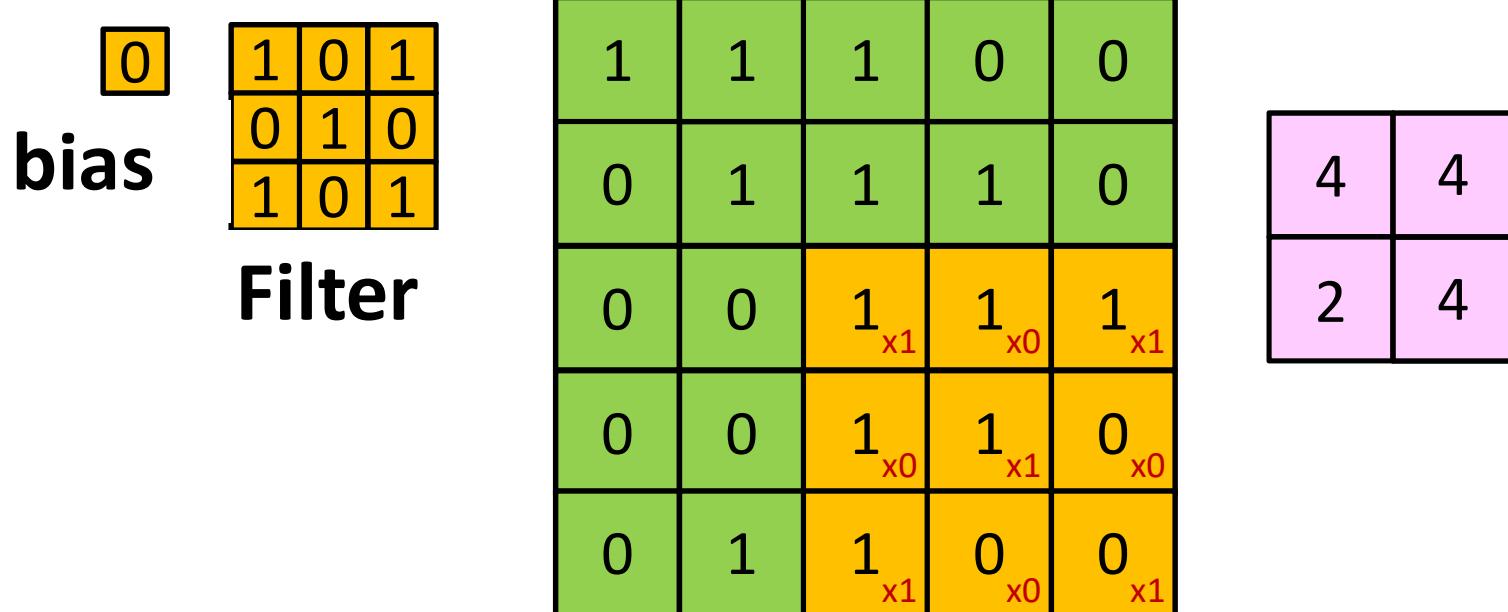

- Scanning an image with a “filter”
 - The filter may proceed by *more* than 1 pixel at a time
 - E.g. with a “stride” of two pixels per shift

Convolution can *shrink* a map by using strides greater than 1

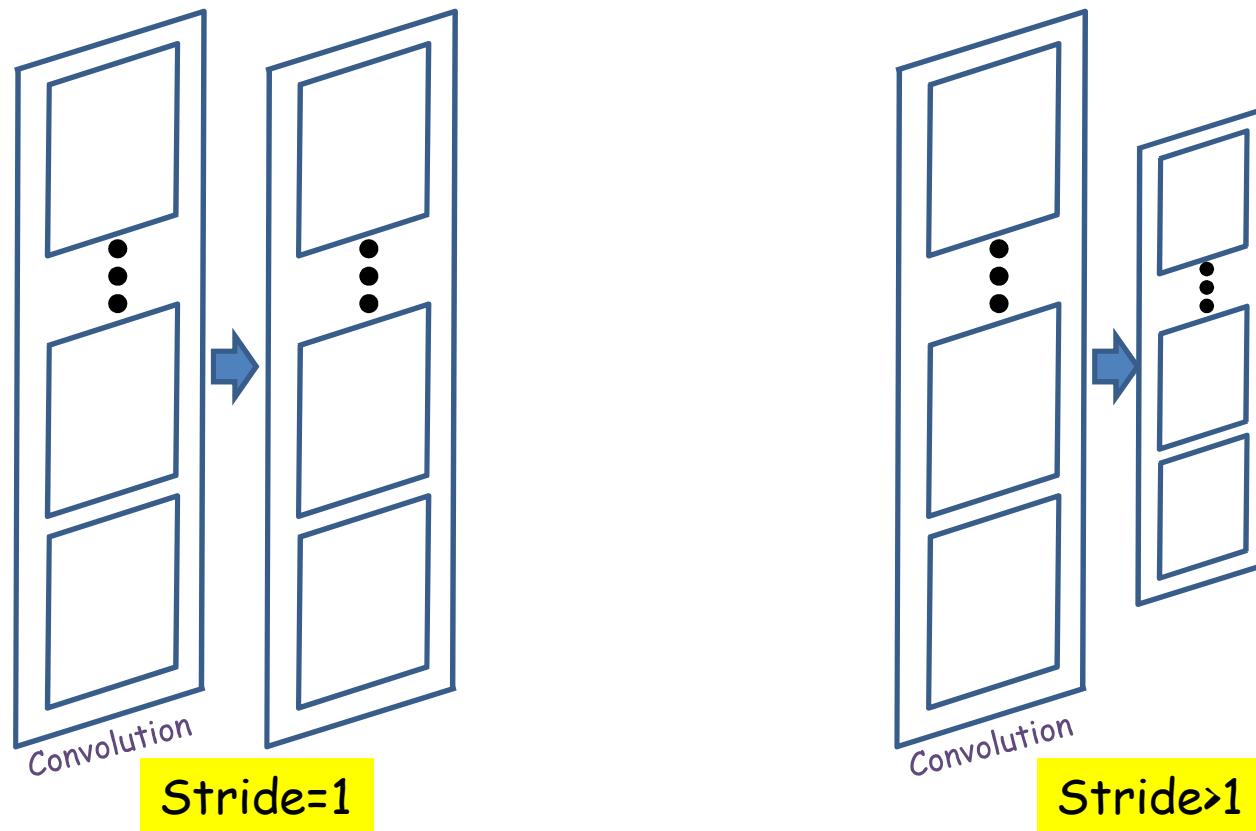

- Scanning an image with a “filter”
 - The filter may proceed by *more* than 1 pixel at a time
 - E.g. with a “stride” of two pixels per shift

Convolution can *shrink* a map by using strides greater than 1

- Scanning an image with a “filter”
 - The filter may proceed by *more* than 1 pixel at a time
 - E.g. with a “stride” of two pixels per shift

Convolution strides

- Convolution with stride 1 → output size same as input size
 - Besides edge effects
- Stride greater than 1 → output size shrinks w.r.t. input

Convolutional neural net: Vector notation

The weight $\mathbf{W}(l, j)$ is now a 3D $D_{l-1} \times K_l \times K_l$ tensor (assuming square receptive fields)

$\mathbf{Y}(0) = \text{Image}$

```
for l = 1:L  # layers operate on vector at (x,y)  
    for j = 1:Dl
```

```
        m = 1
```

```
        for x = 1:stride:Wl-1-Kl+1
```

```
            n = 1
```

```
            for y = 1:stride:Hl-1-Kl+1
```

```
                segment = Y(l-1, :, x:x+Kl-1, y:y+Kl-1) #3D tensor
```

```
                z(l, j, m, n) = W(l, j) . segment #tensor inner prod.
```

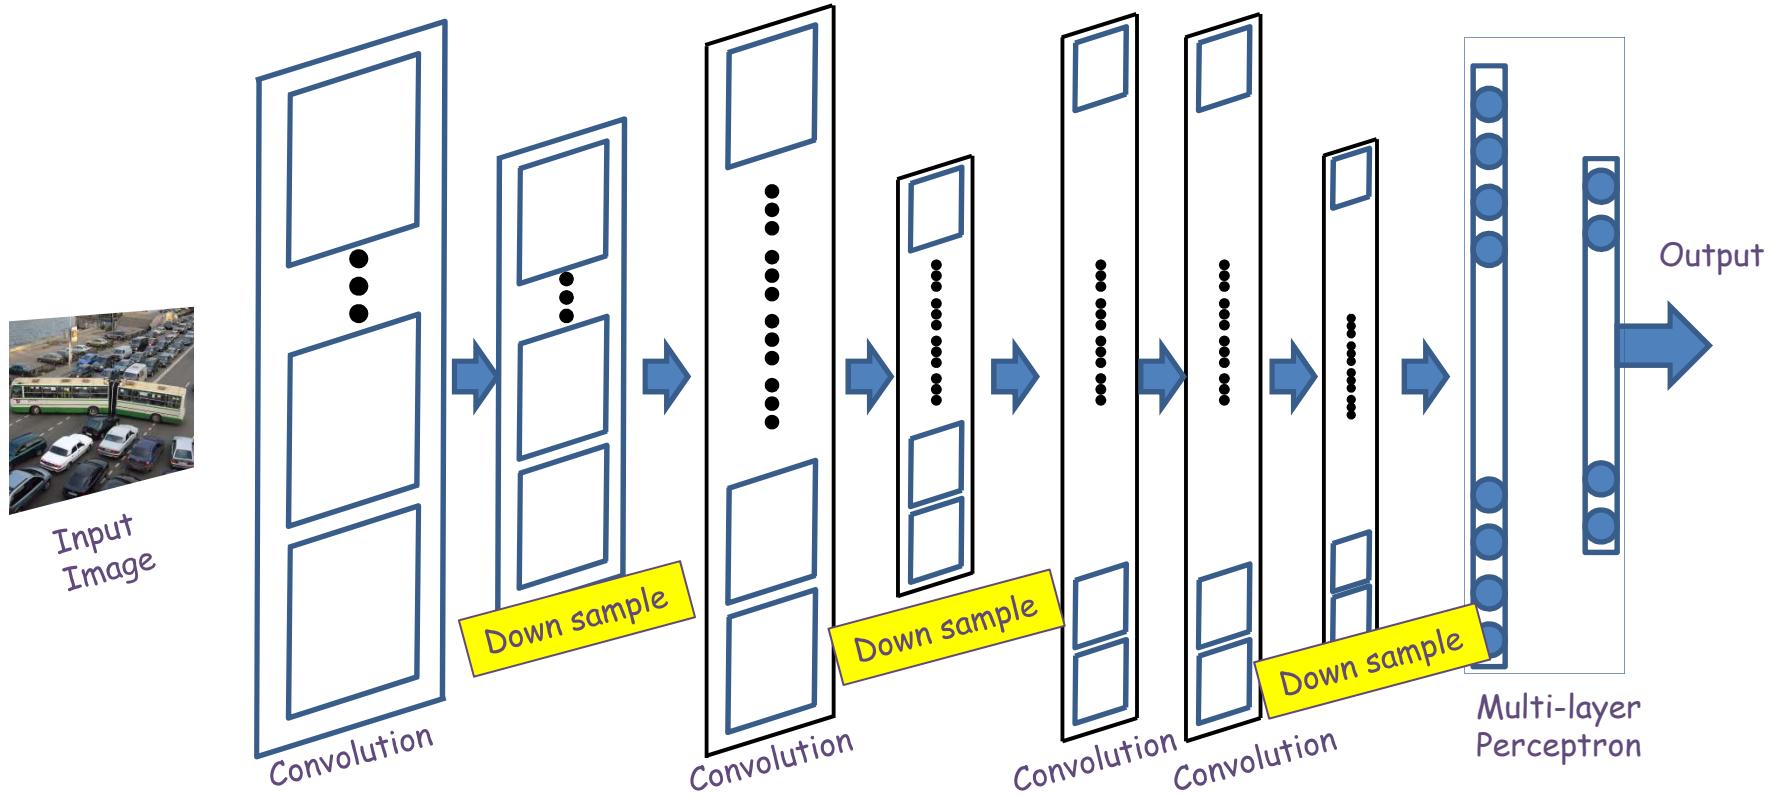

```
                Y(l, j, m, n) = activation(z(l, j, m, n))
```

```
                n++
```

```
            m++
```

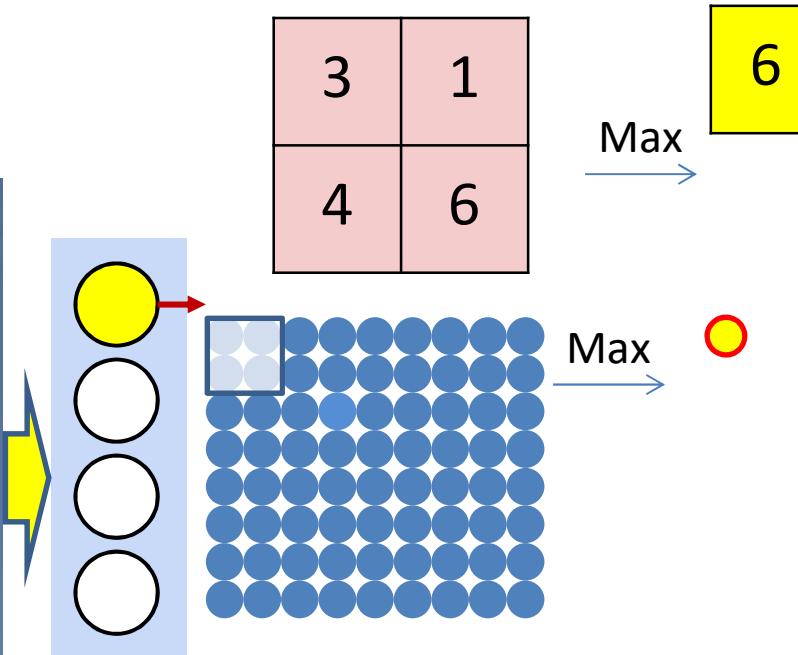

```
Y = softmax( {Y(L, :, :, :, :)} )
```

The other method for shrinking the maps: Downsampling/Pooling

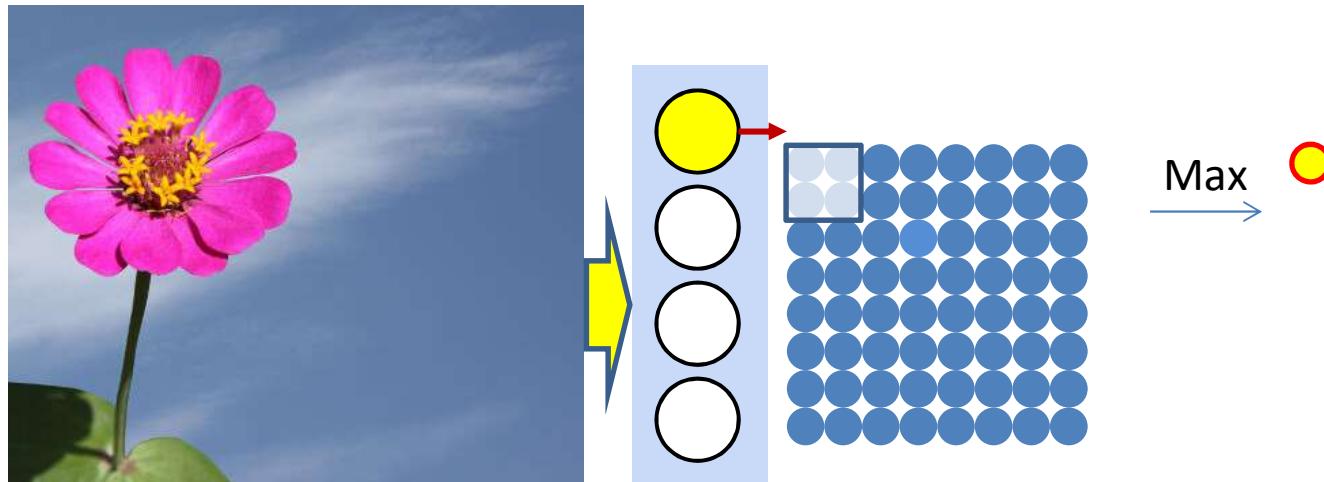

- Convolution (and activation) layers are followed intermittently by “downsampling” (or “pooling”) layers
 - Often, they alternate with convolution, though this is not necessary

Recall: Max pooling

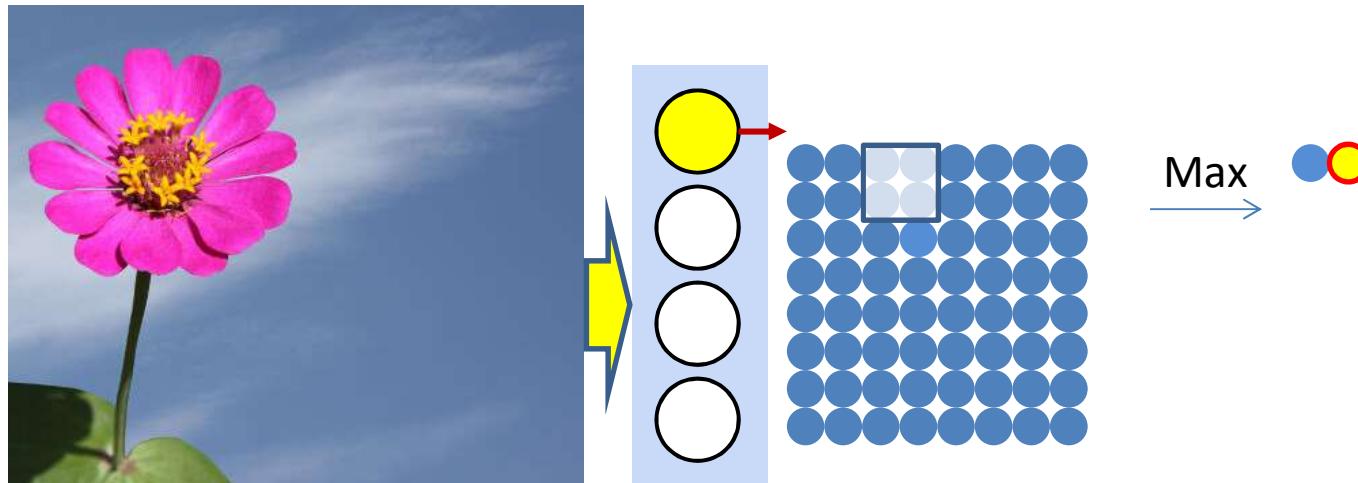

- Max pooling selects the largest from a pool of elements
- Pooling is performed by “scanning” the input

Pooling and downsampling

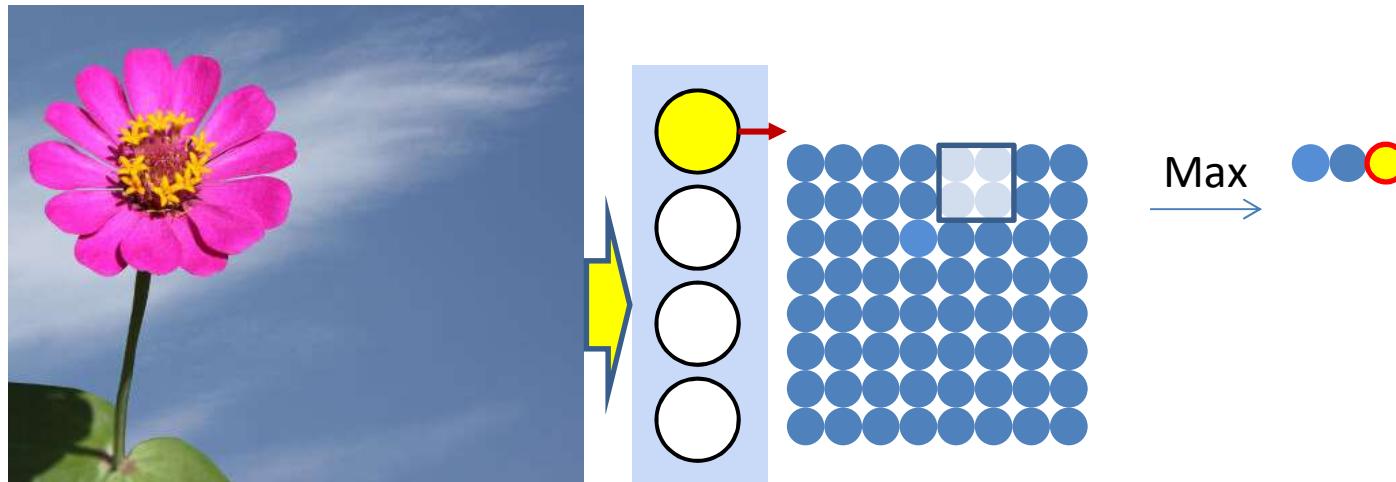

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

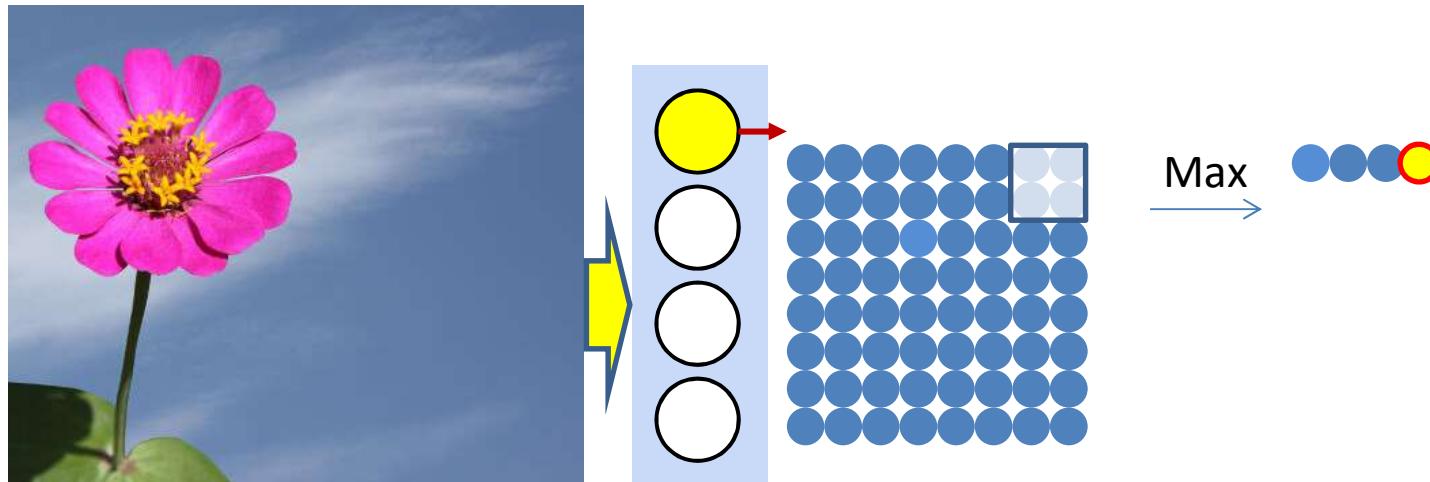

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

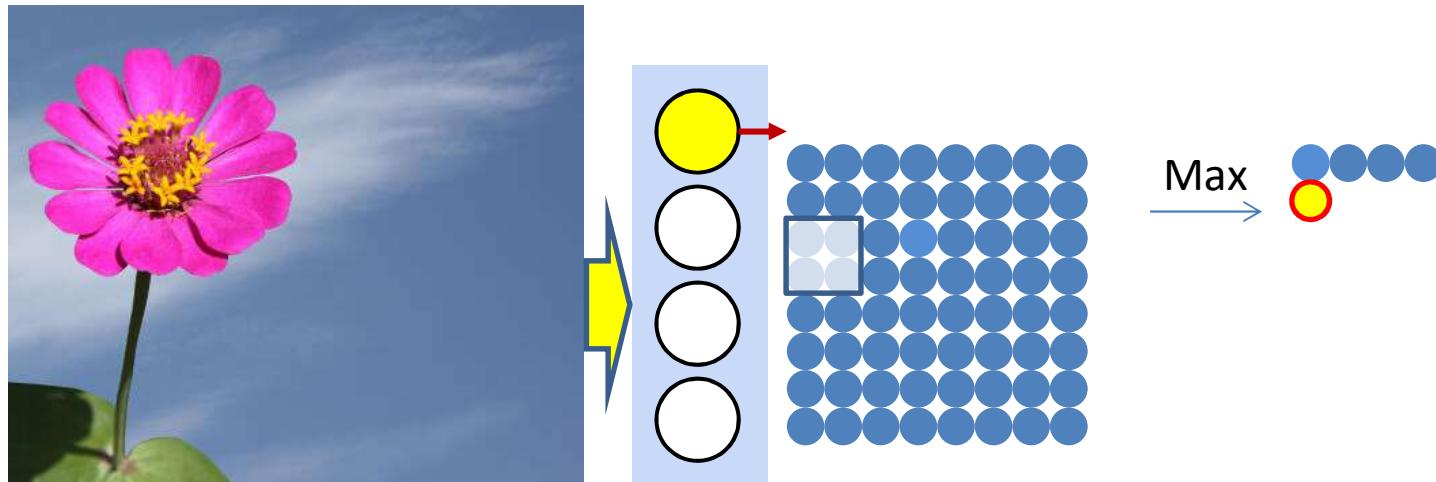

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

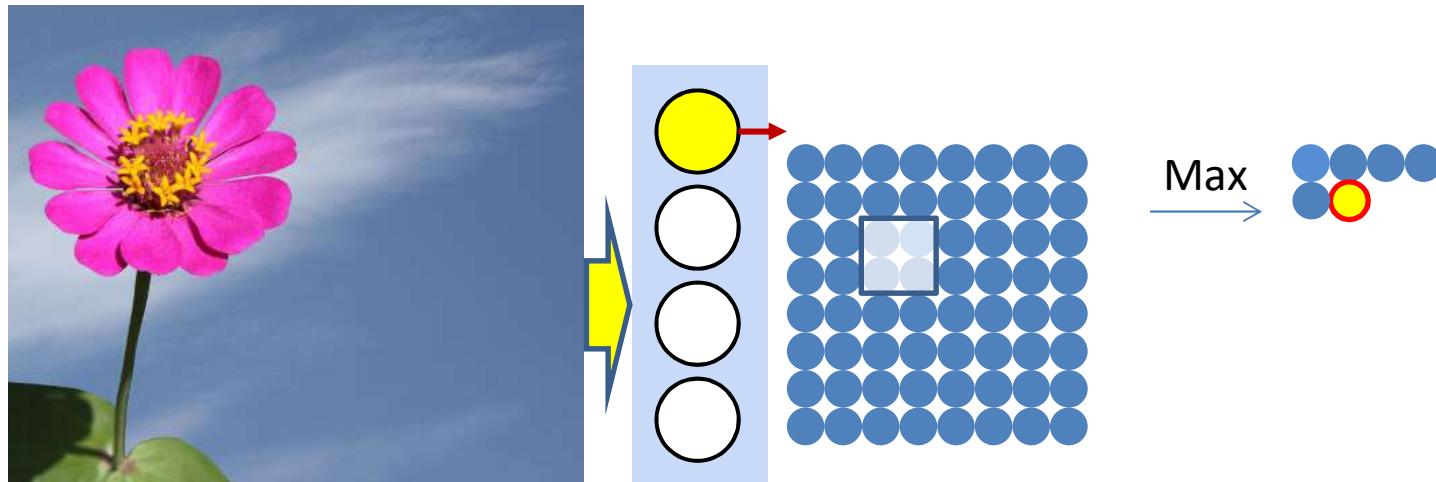

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

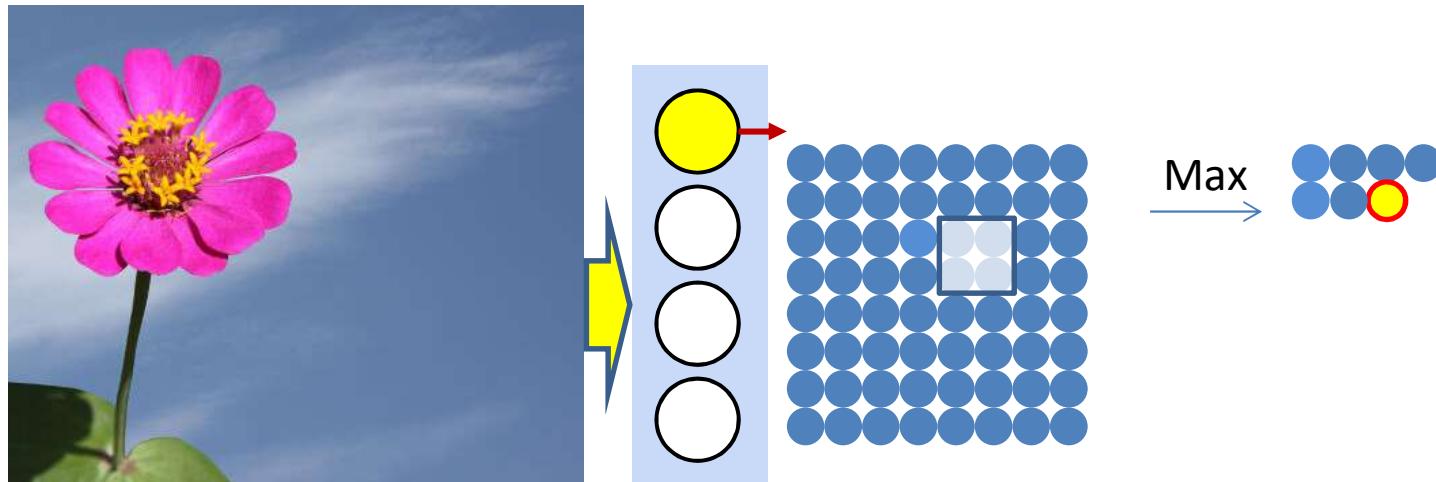

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

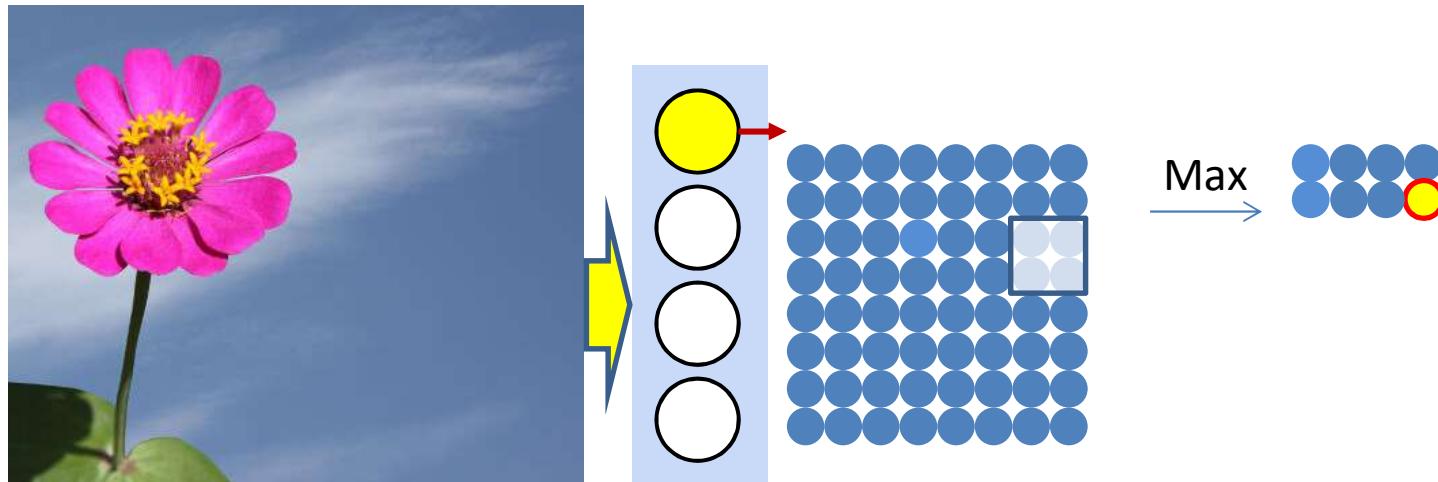

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

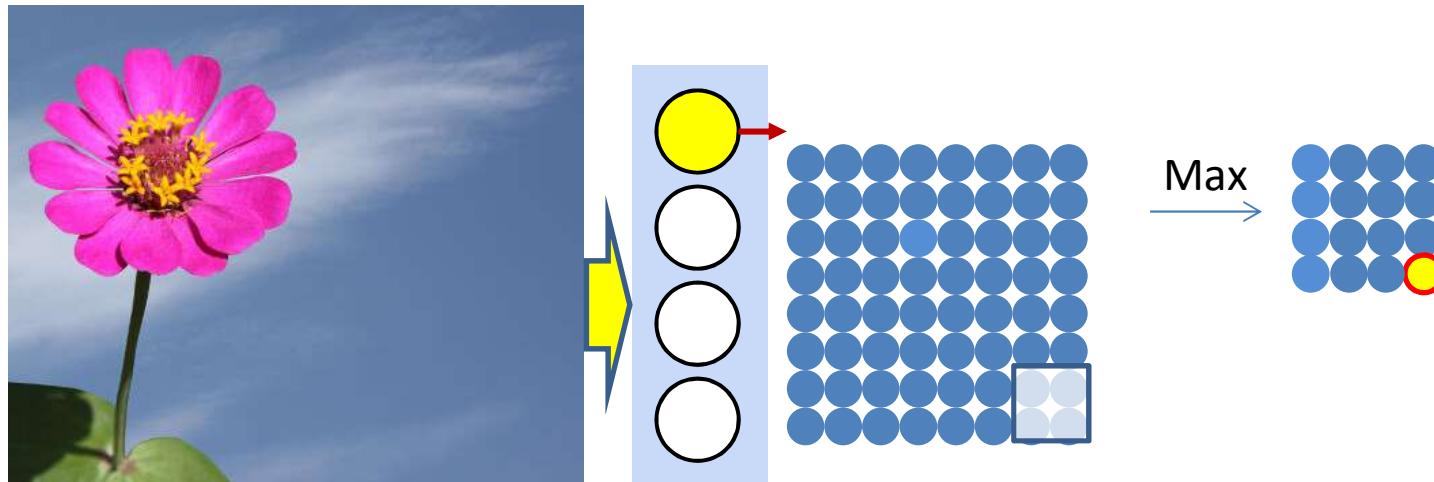

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Pooling and downsampling

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Max Pooling layer at layer l

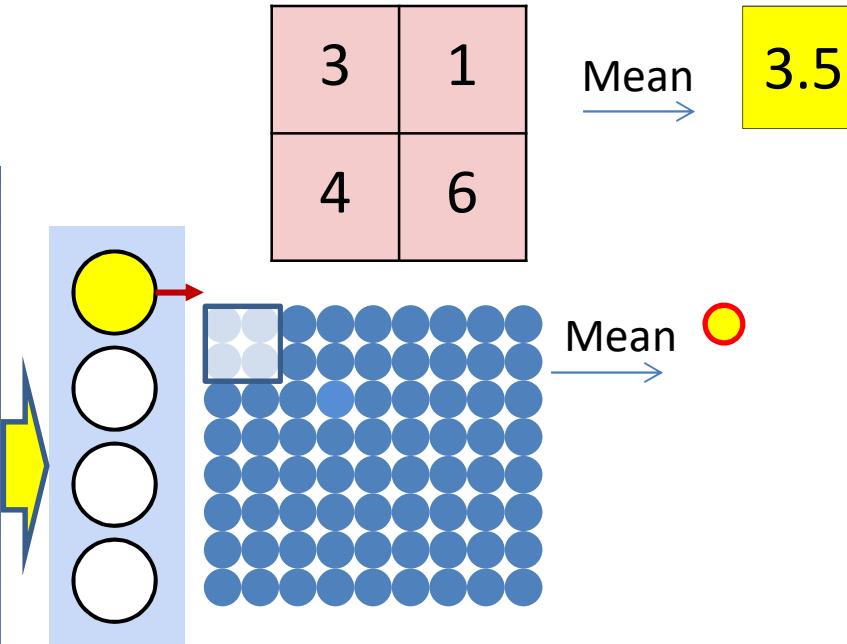

- a) Performed separately for every map (j).
*) Not combining multiple maps within a single max operation.
- b) Keeping track of location of max

Max pooling

```
for j = 1:D1
    m = 1
    for x = 1:stride(l):Wl-1-Kl+1
        n = 1
        for y = 1:stride(l):Hl-1-Kl+1
            pidx(l,j,m,n) = maxidx(Y(l-1,j,x:x+Kl-1,y:y+Kl-1))
            u(l,j,m,n) = Y(l-1,j,pidx(l,j,m,n))
            n = n+1
        m = m+1
```

Recall: Mean pooling

- Mean pooling computes the *mean* of the window of values
 - As opposed to the max of max pooling
- Scanning with strides is otherwise identical to max pooling

Mean Pooling layer at layer l

a) Performed separately for every map (j)

Mean pooling

```
for j = 1:D1
    m = 1
    for x = 1:stride(l):Wl-1-Kl+1
        n = 1
        for y = 1:stride(l):Hl-1-Kl+1
            u(l,j,m,n) = mean(Y(l-1,j,x:x+Kl-1,y:y+Kl-1))
            n = n+1
        m = m+1
```

Setting everything together

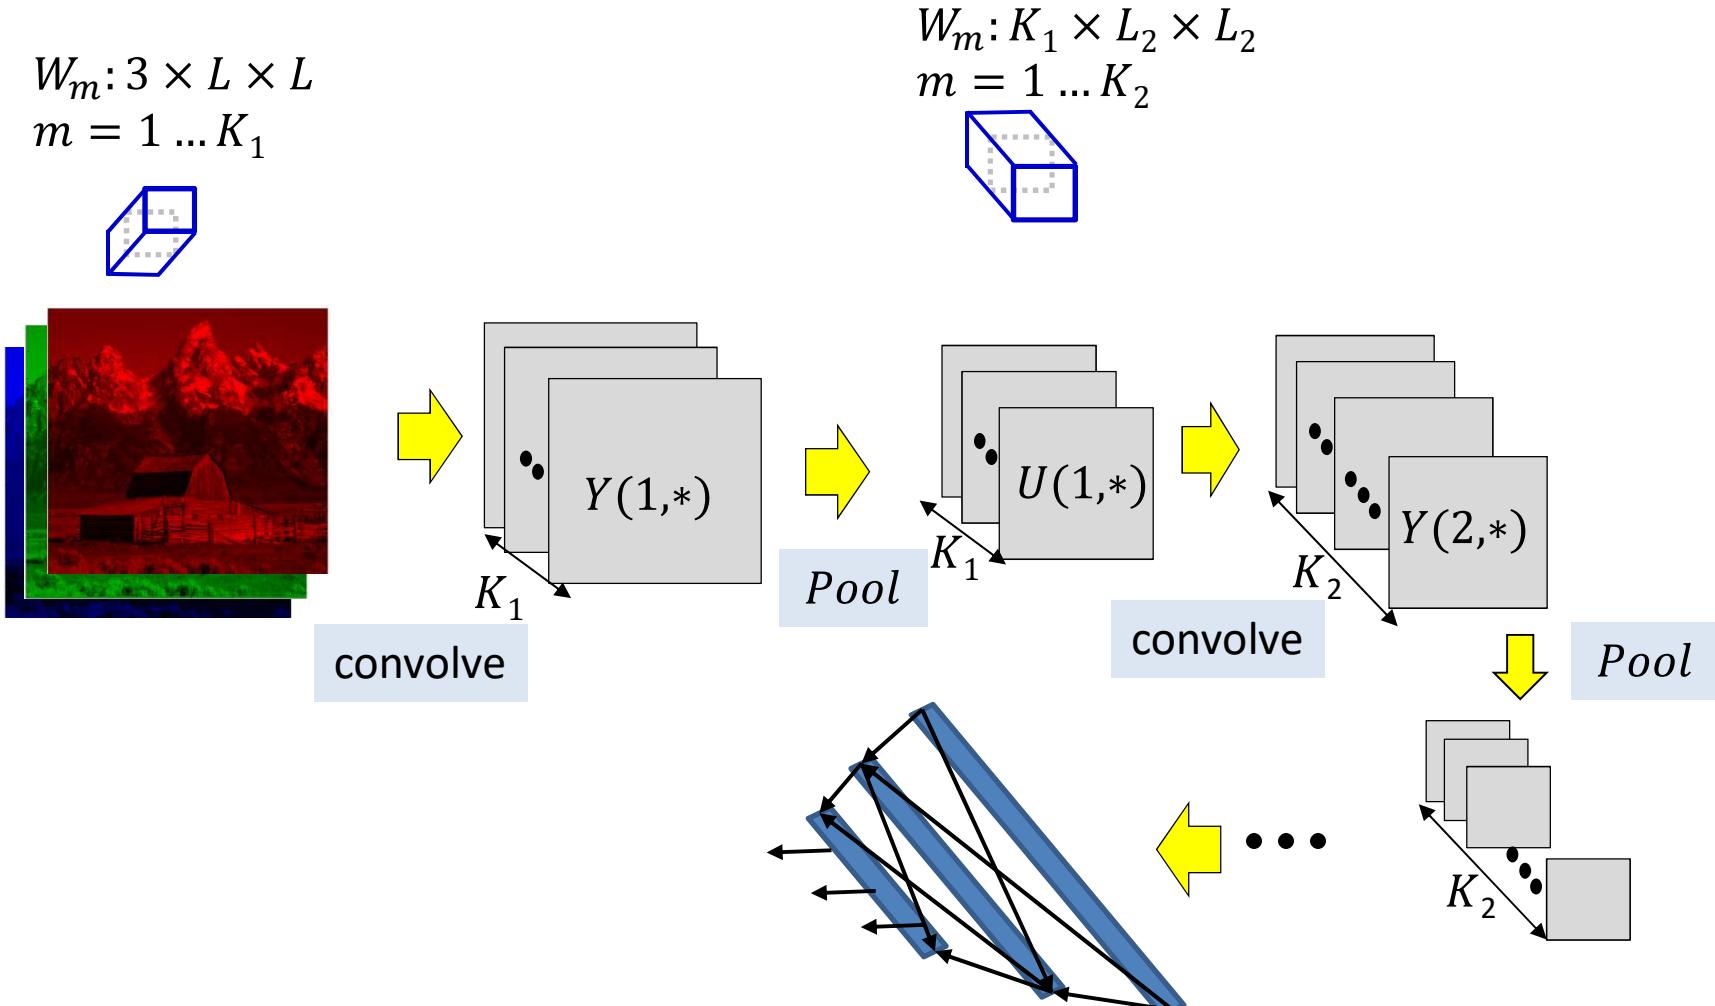

- Typical image classification task
 - Assuming maxpooling..

Convolutional Neural Networks

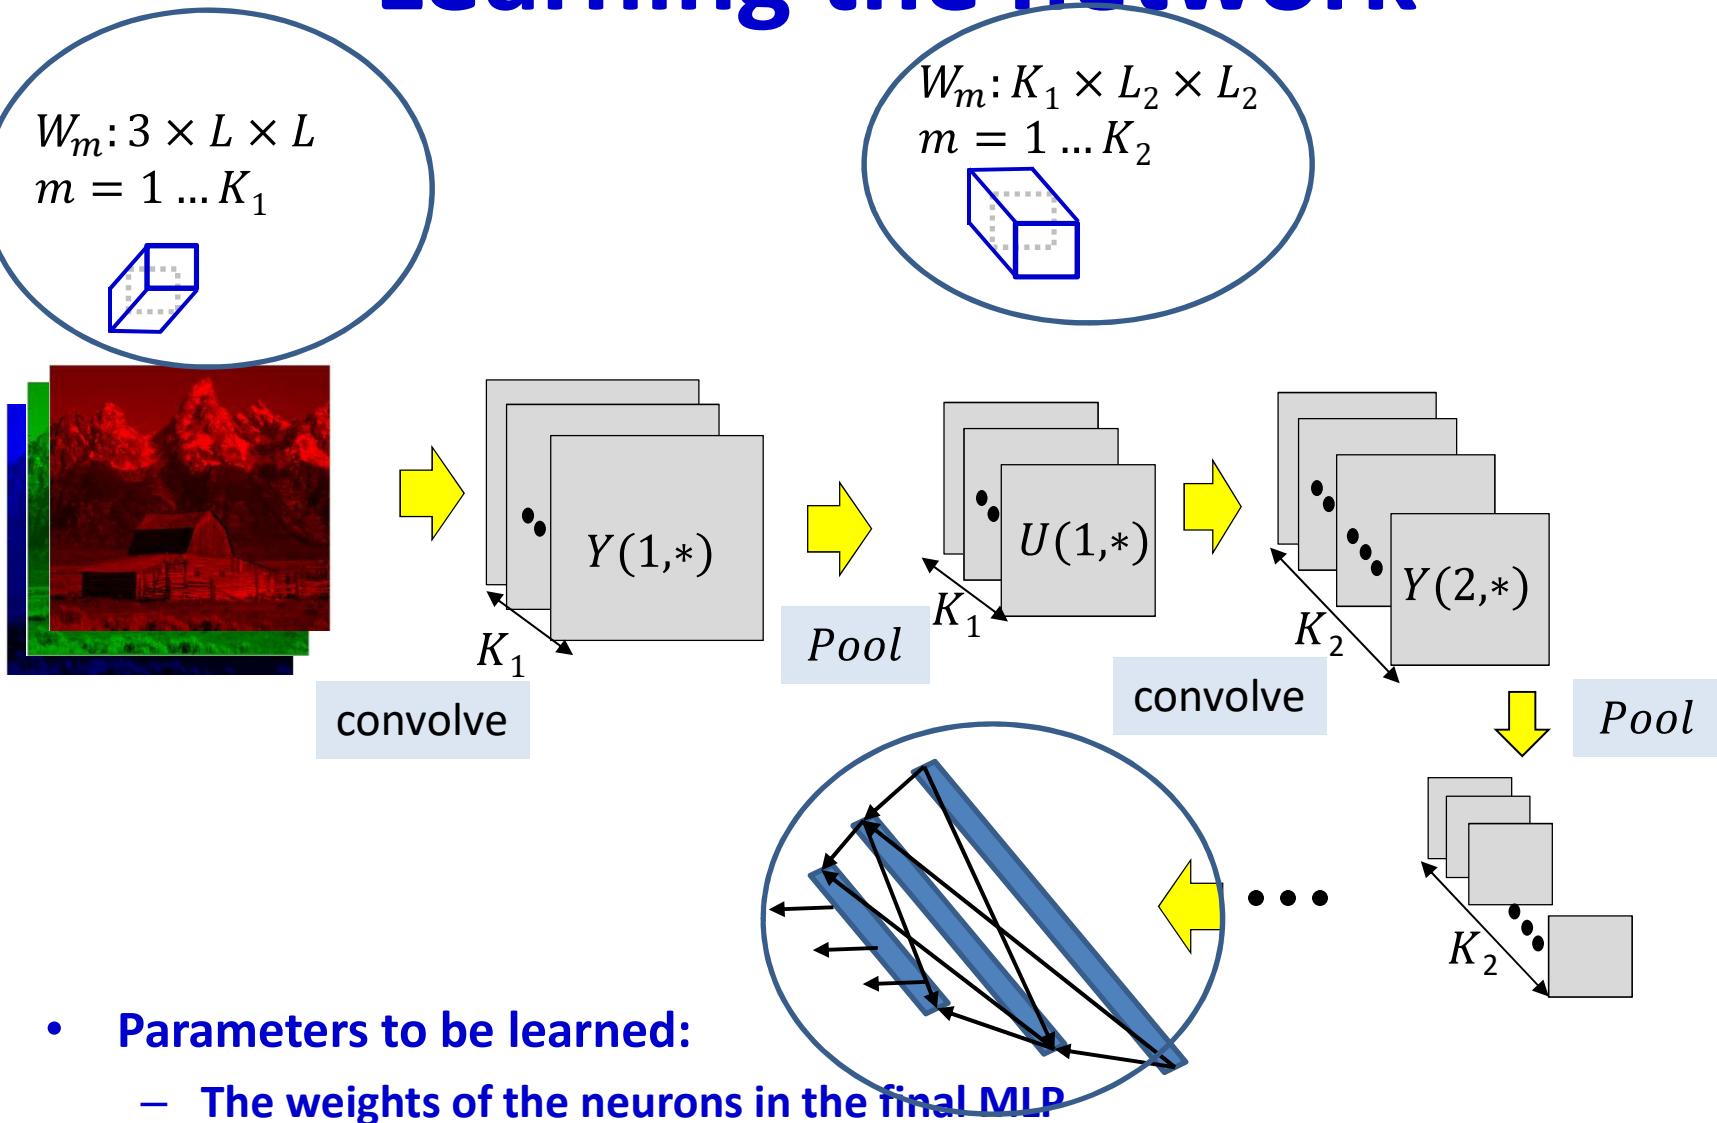

- Input: 1 or 3 images
 - Black and white or color
 - Will assume color to be generic

Convolutional Neural Networks

- Several convolutional and pooling layers.
- The output of the last layer is “flattened” and passed through an MLP

Learning the network

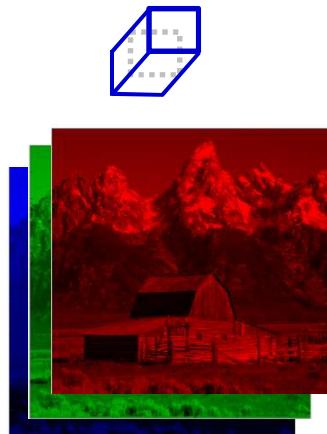

Learning the CNN

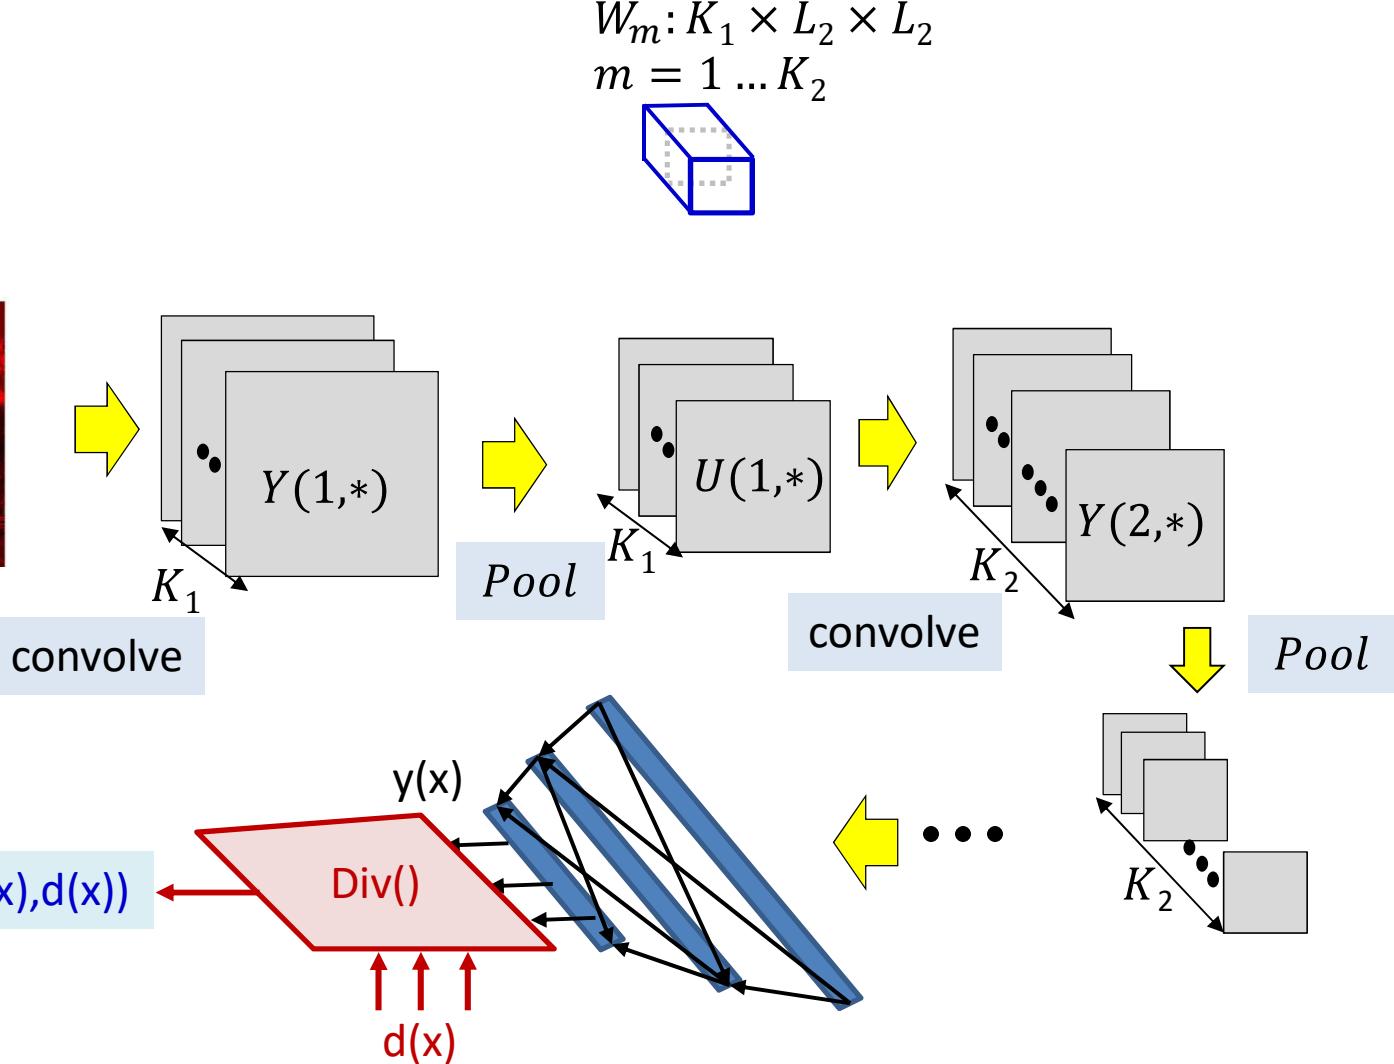

- Training is as in the case of the regular MLP
 - The *only* difference is in the *structure* of the network
- **Training examples of (Image, class) are provided**
- Define a divergence between the desired output and true output of the network in response to any input
- **Network parameters are trained through variants of gradient descent**
- **Gradients are computed through backpropagation**

Defining the loss

$$W_m: 3 \times L \times L \\ m = 1 \dots K_1$$

Input: x

- The loss for a single instance

Problem Setup

- Given a training set of input-output pairs $(X_1, d_1), (X_2, d_2), \dots, (X_T, d_T)$
- The error on the i^{th} instance is $\text{div}(Y_i, d_i)$
- The total error

$$\textit{Loss} = \frac{1}{T} \sum_{i=1}^T \text{div}(Y_i, d_i)$$

- Minimize \textit{Loss} w.r.t $\{W_m, b_m\}$

Training CNNs through Gradient Descent

Total training loss:

$$Loss = \frac{1}{T} \sum_{i=1}^T div(Y_i, d_i)$$

Assuming the bias is also represented as a weight

- Gradient descent algorithm:
- Initialize all weights and biases $\{w(:,:, :, :, :, :)\}$
- Do:
 - For every layer l for all filter indices m , update:
 - $w(l, m, j, x, y) = w(l, m, j, x, y) - \eta \frac{dLoss}{dw(l, m, j, x, y)}$
- Until Err has converged

Training CNNs through Gradient Descent

Total training loss:

$$Loss = \frac{1}{T} \sum_{i=1}^T div(Y_i, d_i)$$

Assuming the bias is also represented as a weight

- Gradient descent algorithm:
- Initialize all weights and biases $\{w(:,:, :, :, :, :)\}$
- Do:
 - For every layer l for all filter indices m , update:
 - $w(l, m, j, x, y) = w(l, m, j, x, y) - \eta \frac{dLoss}{dw(l, m, j, x, y)}$
- Until $Loss$ has converged

The derivative

Total training loss:

$$Loss = \frac{1}{T} \sum_i Div(Y_i, d_i)$$

- Computing the derivative

Total derivative:

$$\frac{dLoss}{dw(l, m, j, x, y)} = \frac{1}{T} \sum_i \frac{dDiv(Y_i, d_i)}{dw(l, m, j, x, y)}$$

The derivative

Total training loss:

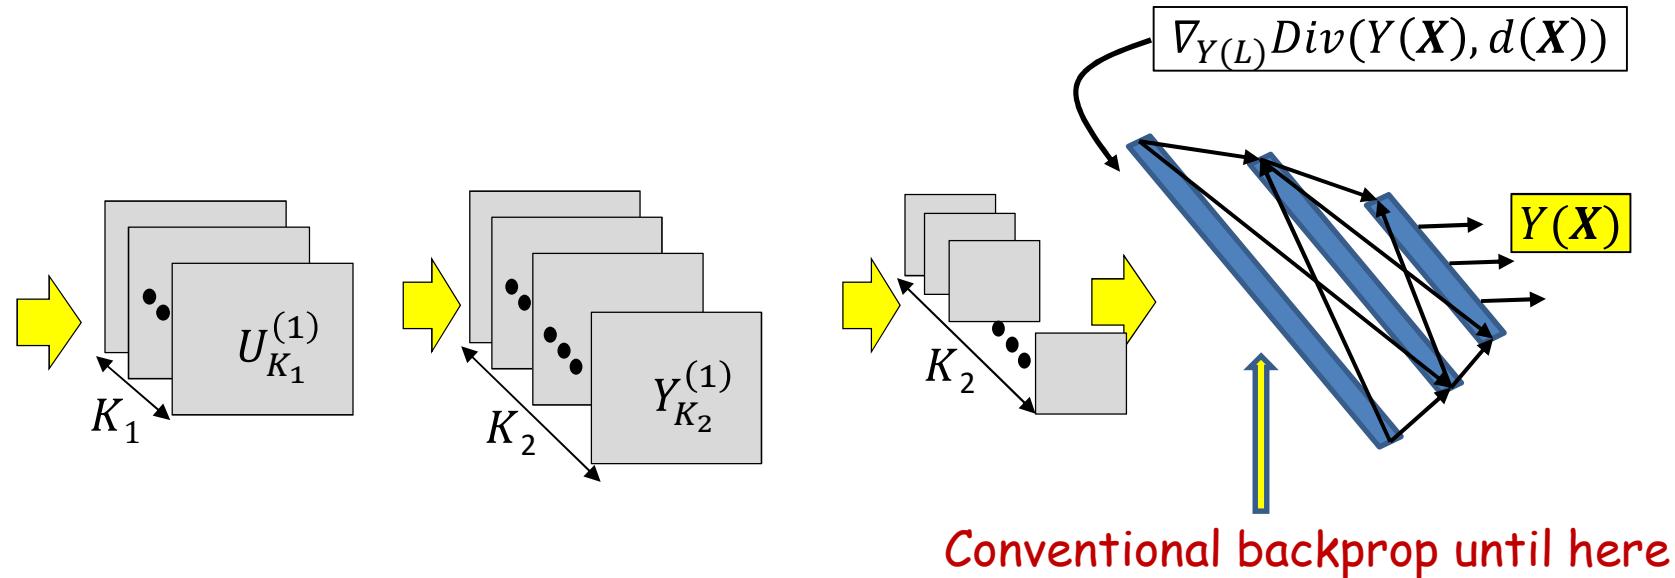

$$Loss = \frac{1}{T} \sum_i Div(Y_i, d_i)$$

- Computing the derivative

Total derivative:

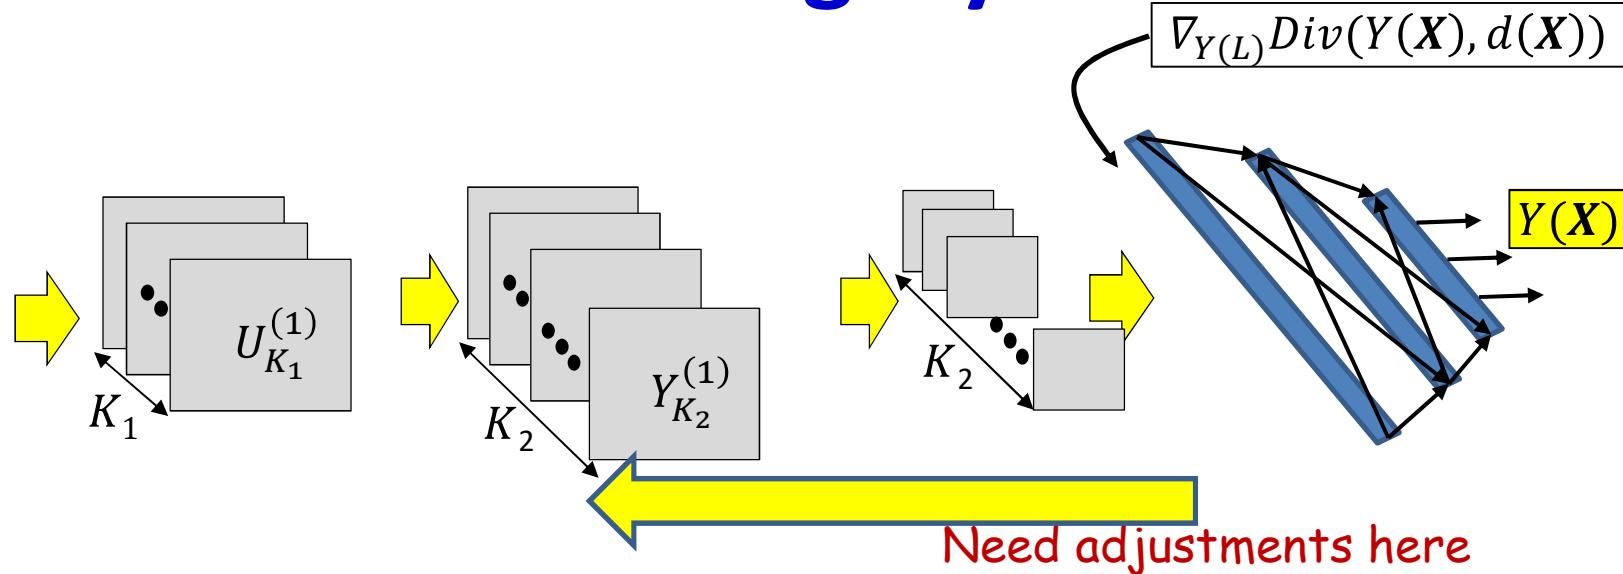

$$\frac{dLoss}{dw(l, m, j, x, y)} = \frac{1}{T} \sum_i \frac{dDiv(Y_i, d_i)}{dw(l, m, j, x, y)}$$

Backpropagation: Final flat layers

- Backpropagation continues in the usual manner until the computation of the derivative of the divergence w.r.t the inputs to the first “flat” layer
 - Important to recall: the first flat layer is only the “unrolling” of the maps from the final convolutional layer

Backpropagation: Convolutional and Pooling layers

- Backpropagation from the flat MLP requires special consideration of
 - The shared computation in the convolution layers
 - The pooling layers (particularly maxout)

BP: Convolutional layer

1 x1	1 x0	1 x1	0	0
0 x0	1 x1	1 x0	1	0
0 x1	0 x0	1 x1	1	1
0	0	1	1	0
0	1	1	0	0

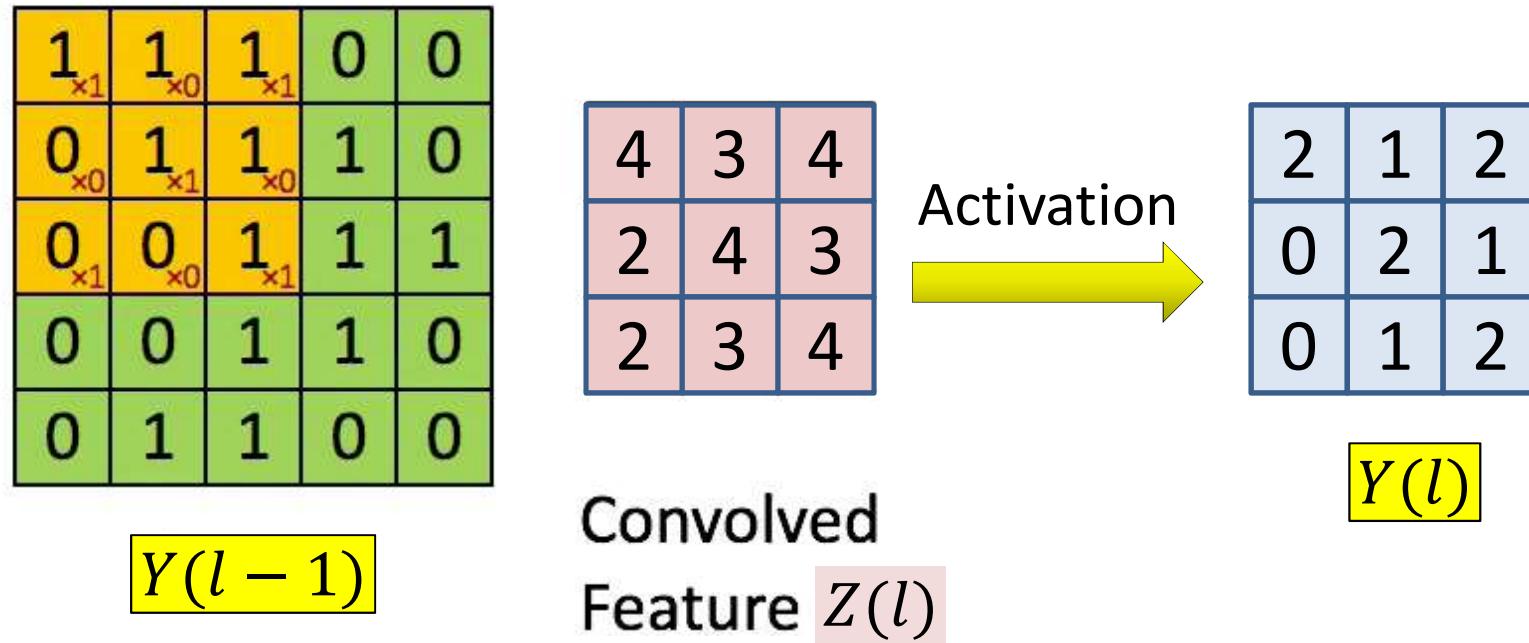

$Y(l - 1)$

4		

Convolved
Feature $Z(l)$

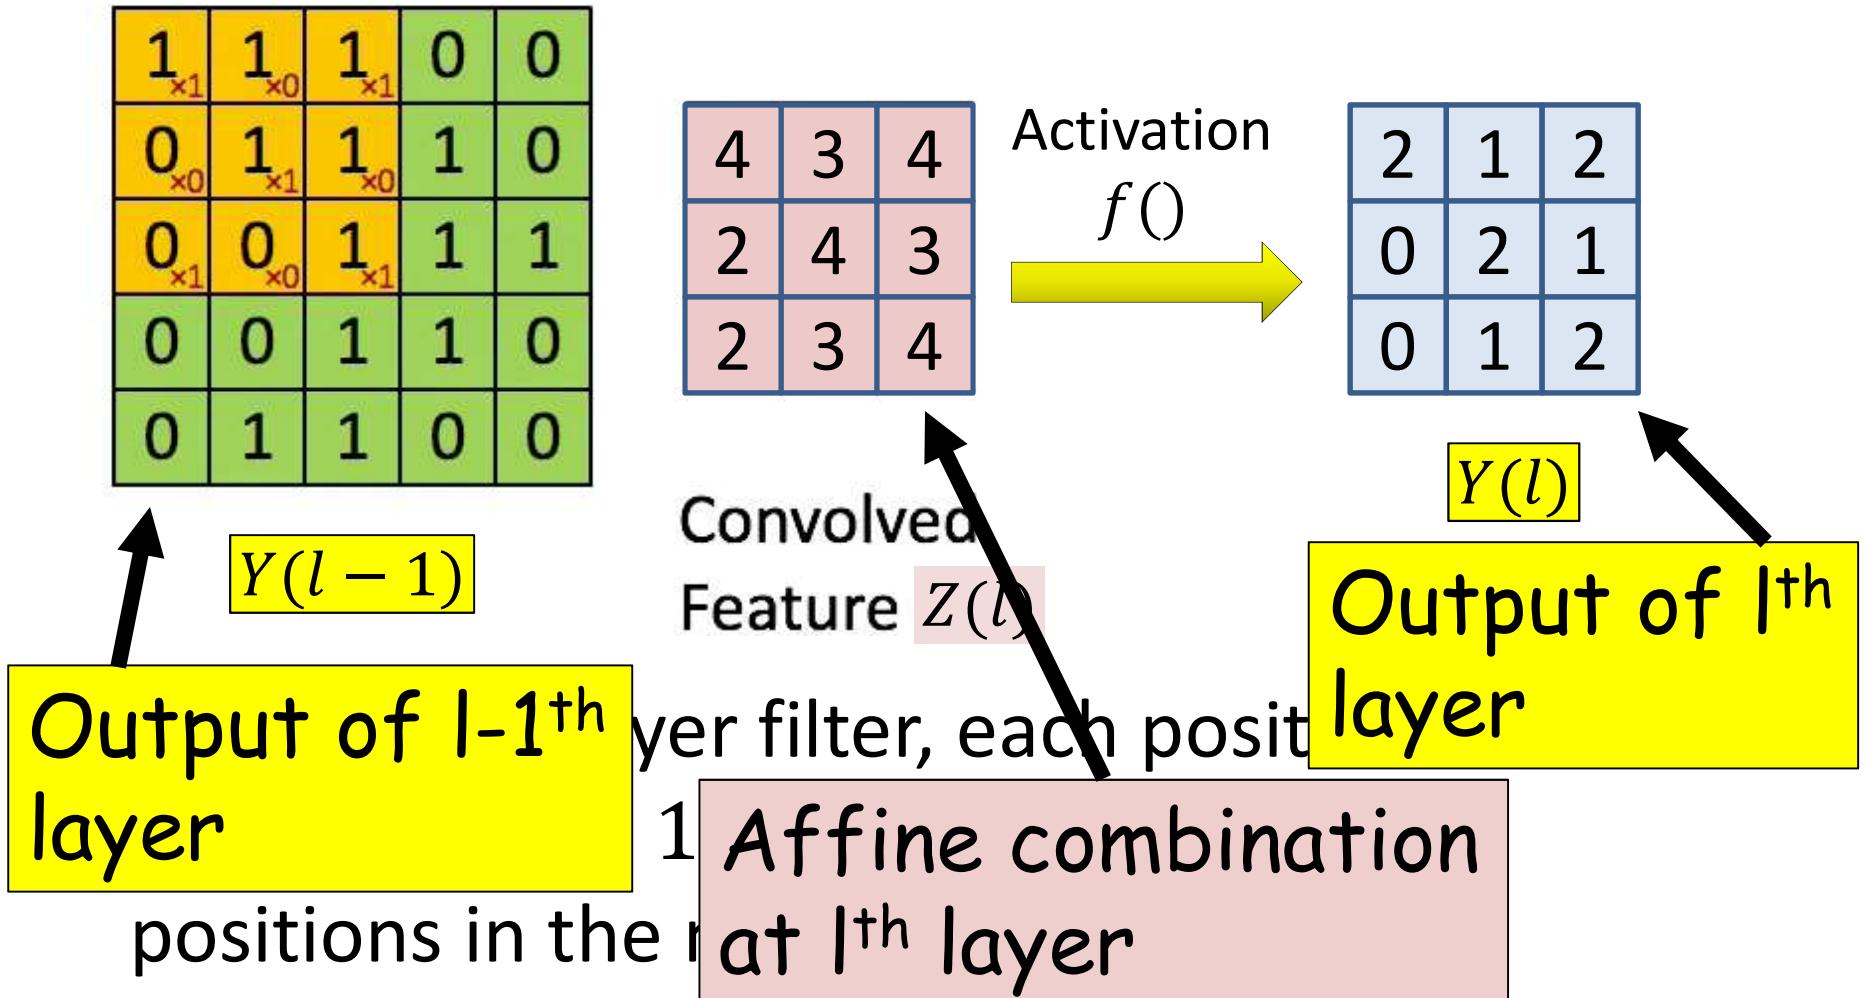

- For every l^{th} layer filter, each position in the map in the $l - 1^{\text{th}}$ layer affects several positions in the map of the l^{th} layer

BP: Convolutional layer

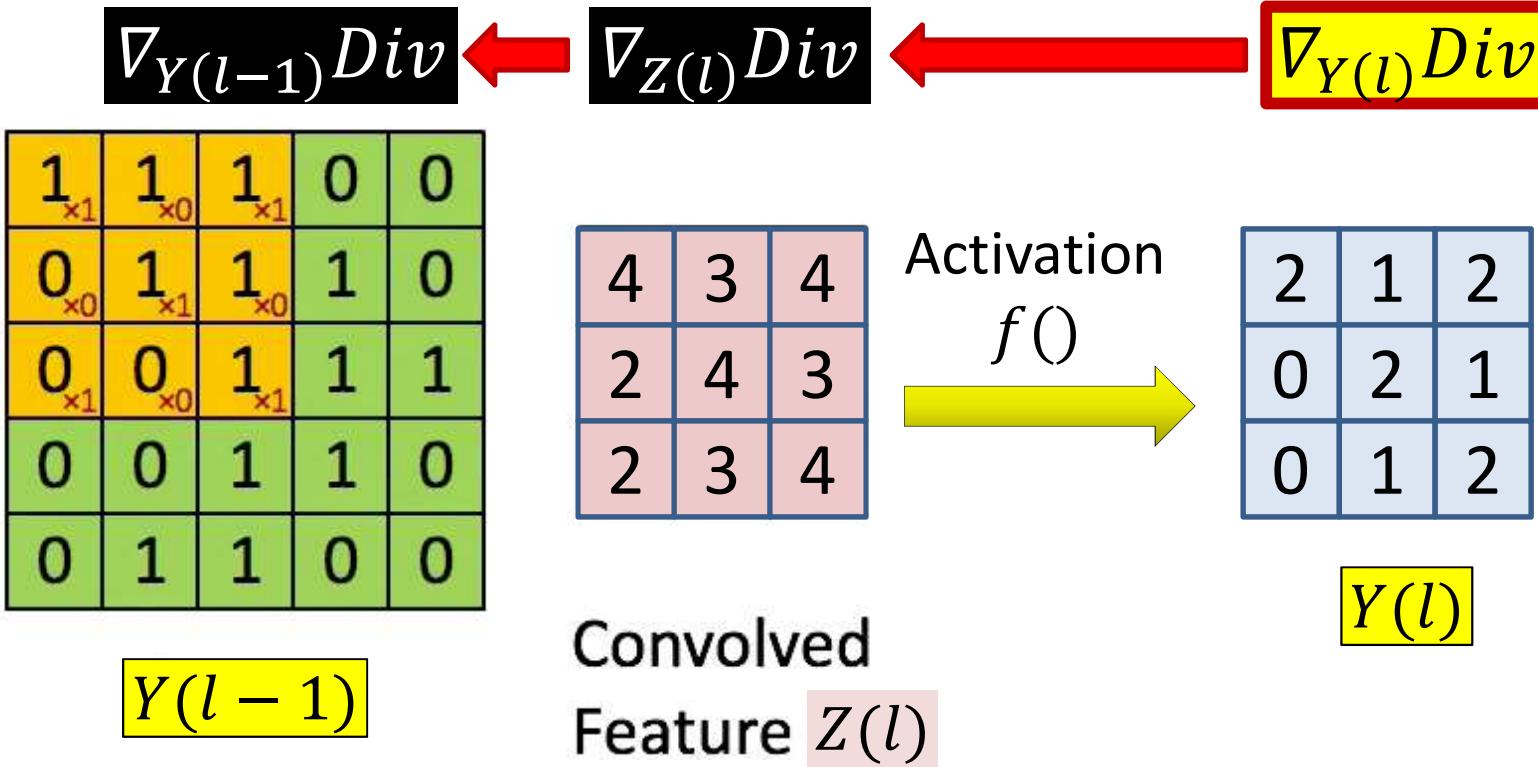

- For every l^{th} layer filter, each position in the map in the $l - 1^{\text{th}}$ layer affects several positions in the map of the l^{th} layer

BP: Convolutional layer

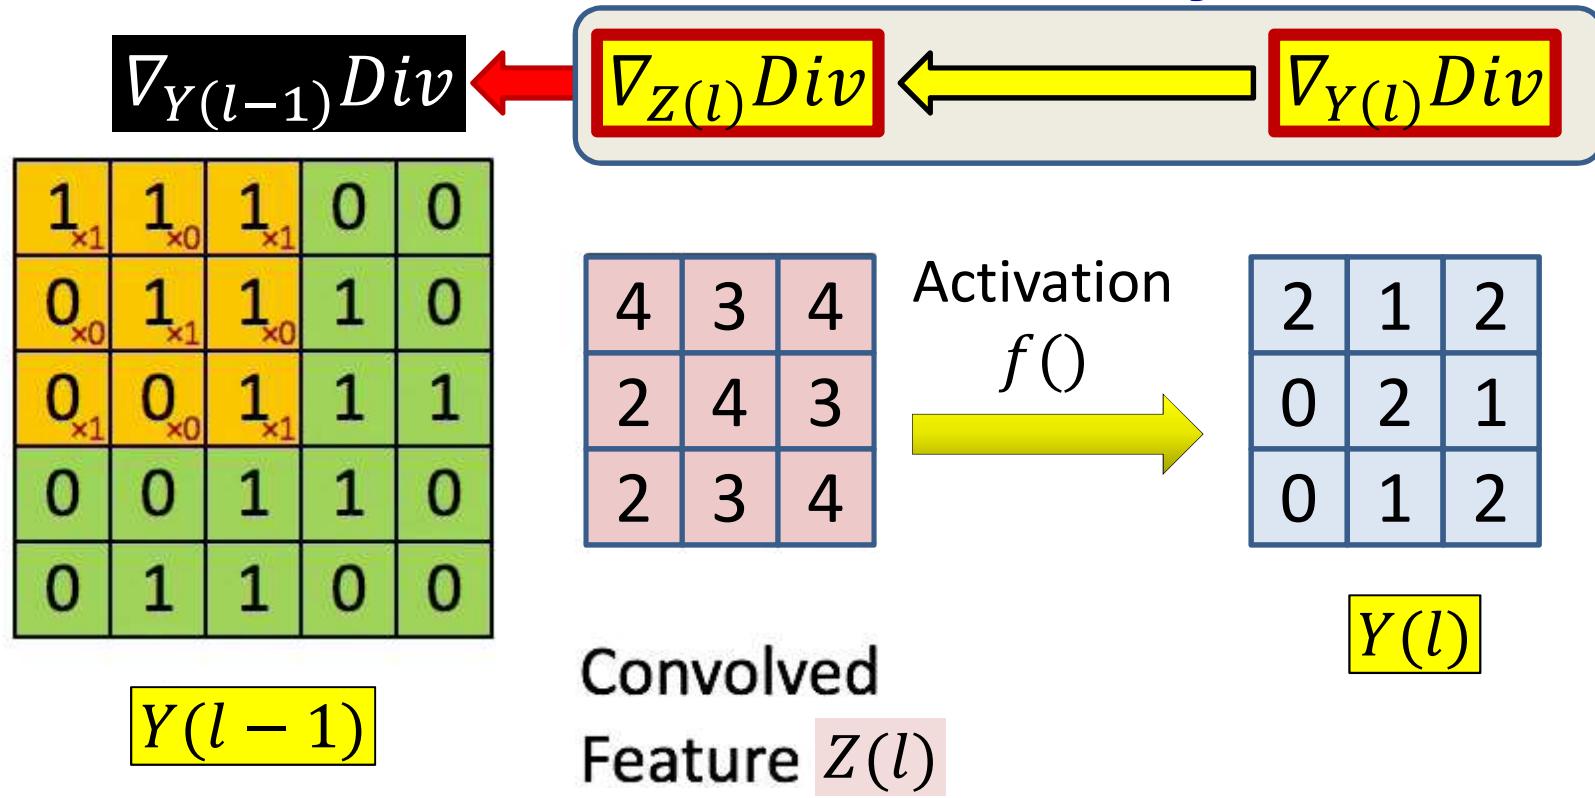

BP: Convolutional layer

- Assuming $\nabla_{Y(l)}Div$ is available
 - Remember – it is available for the L^{th} layer already from the flat MLP
- Must compute $\nabla_{Z(l)}Div$ and $\nabla_{Y(l-1)}Div$

BP: Convolutional layer

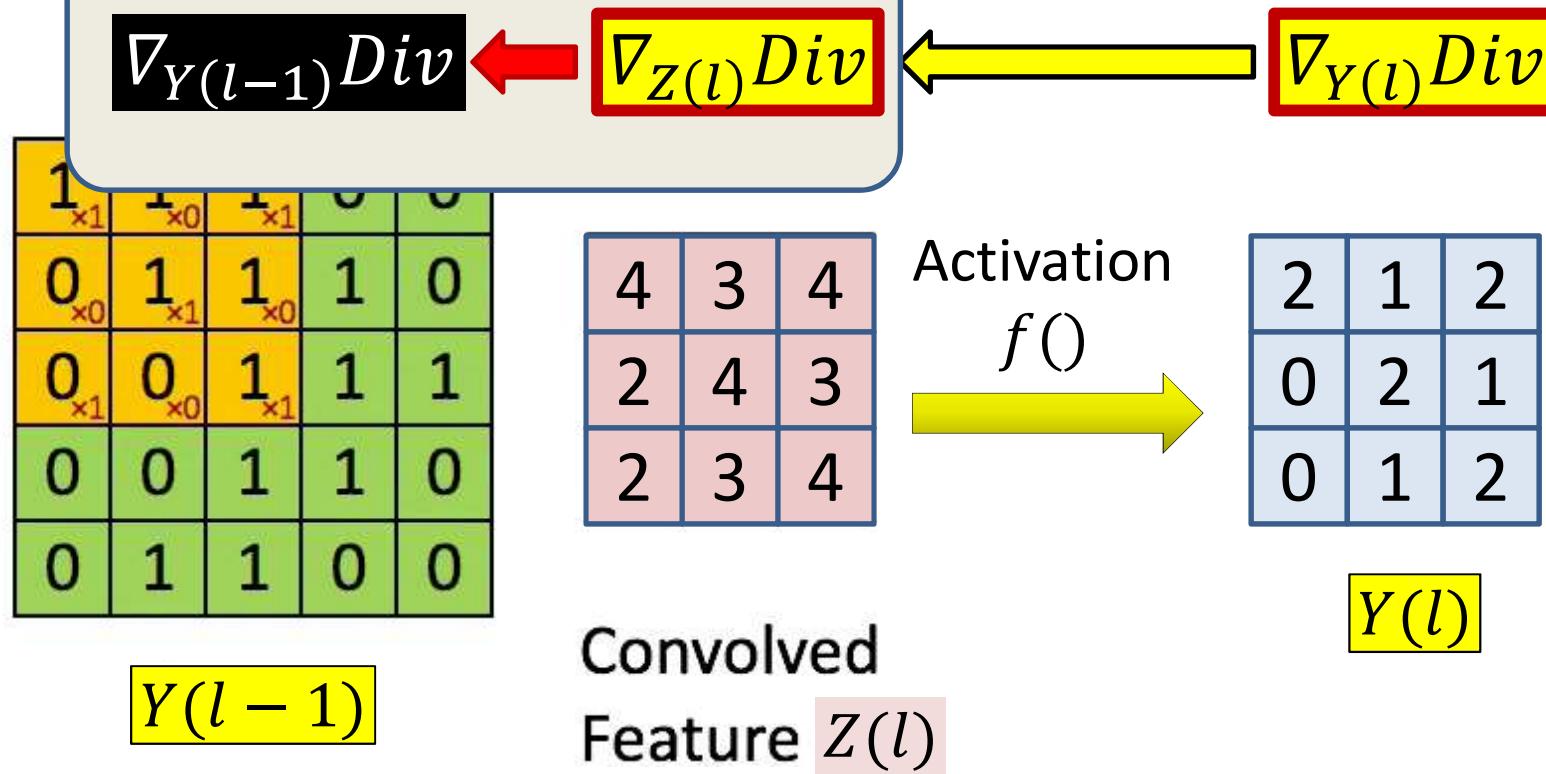

- Computing $\nabla_{Z(l)} Div$

$$\frac{dDiv}{dz(l, m, x, y)} = \frac{dDiv}{d Y(l, m, x, y)} f'(z(l, m, x, y))$$

- Simple component-wise computation

BP: Convolutional layer

- Computing $\nabla_{Y(l-1)} \text{Div}$ and $\nabla_{W(l)} \text{Div}$
- Each $Y(l-1, m, x, y)$ affects several $z(l, *, x, y)$ terms
 - All of them contribute to the derivative w.r.t. $Y(l-1, m, x, y)$

BP: Convolutional layer

1 <small>$\times 1$</small>	1 <small>$\times 0$</small>	1 <small>$\times 1$</small>	0	0
0 <small>$\times 0$</small>	1 <small>$\times 1$</small>	1 <small>$\times 0$</small>	1	0
0 <small>$\times 1$</small>	0 <small>$\times 0$</small>	1 <small>$\times 1$</small>	1	1
0	0	1	1	0
0	1	1	0	0

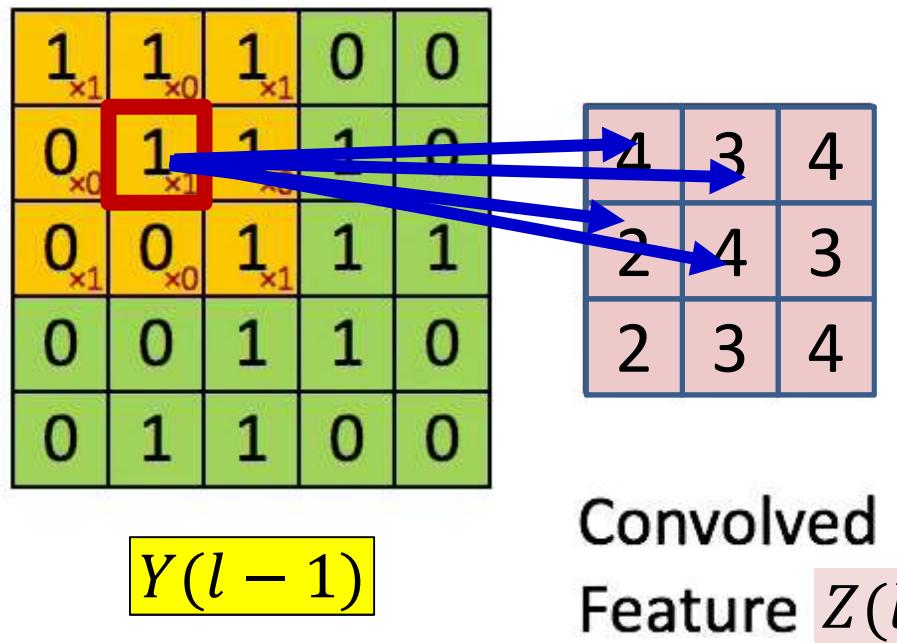

$Y(l - 1)$

4		

Convolved
Feature $Z(l)$

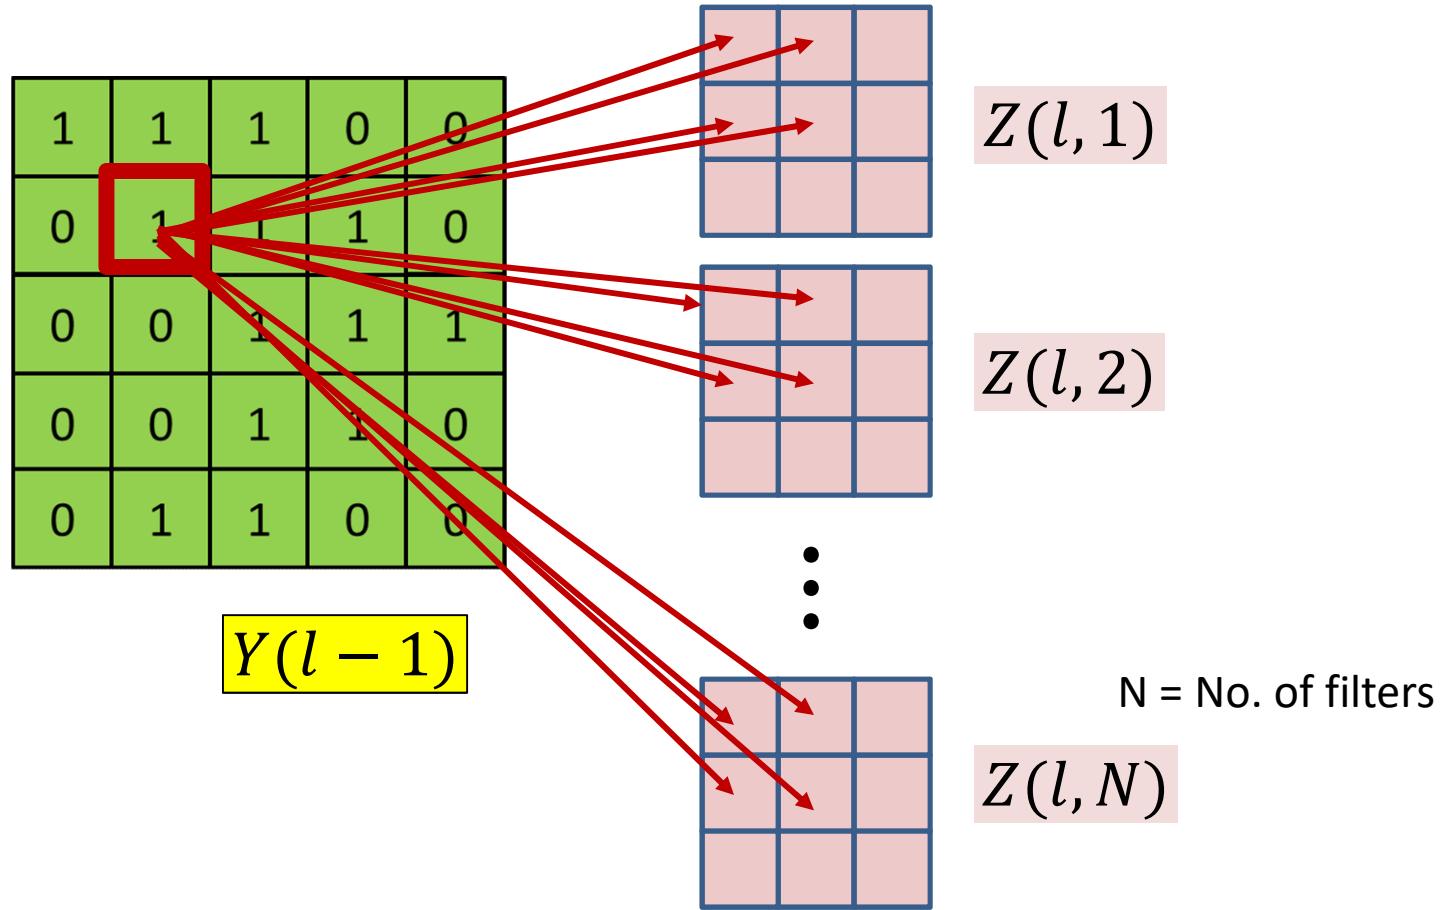

- Each $Y(l - 1, m, x, y)$ affects several $z(l, n, x, y)$ terms

BP: Convolutional layer

- Each $Y(l - 1, m, x, y)$ affects several $z(l, n, x, y)$ terms

BP: Convolutional layer

- Each $Y(l-1, m, x, y)$ affects several $z(l, n, x', y')$ terms
 - Through $w_l(m, n, x - x', y - y')$
 - Affects terms in *all* l^{th} layer Z maps

Assuming indexing
is from 0

BP: Convolutional layer

1 <small>$\times 1$</small>	1 <small>$\times 0$</small>	1 <small>$\times 1$</small>	0	0
0 <small>$\times 0$</small>	1 <small>$\times 1$</small>	1 <small>$\times 0$</small>	1	0
0 <small>$\times 1$</small>	0 <small>$\times 0$</small>	1 <small>$\times 1$</small>	1	1
0	0	1	1	0
0	1	1	0	0

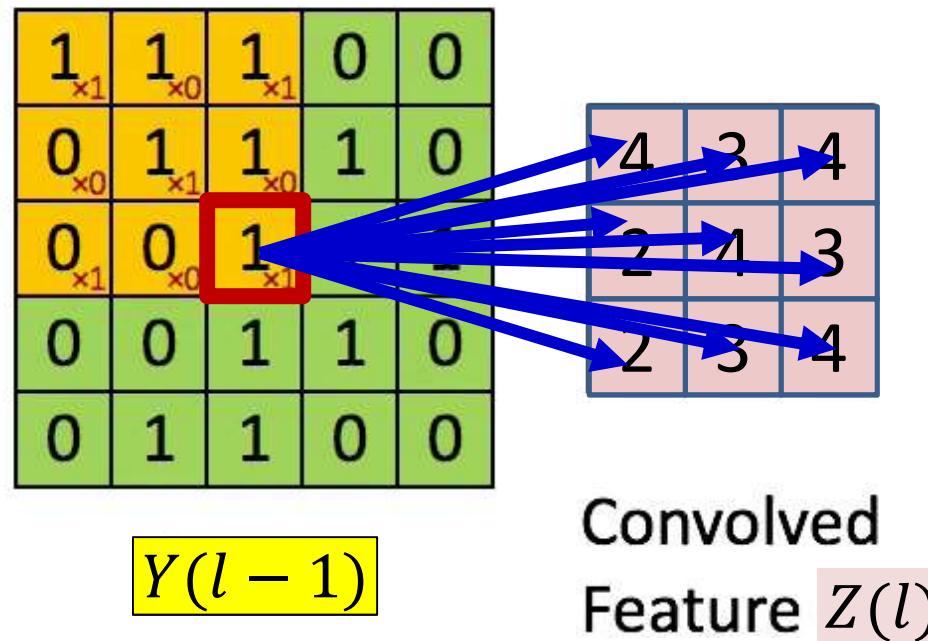

$Y(l - 1)$

4		

Convolved
Feature $Z(l)$

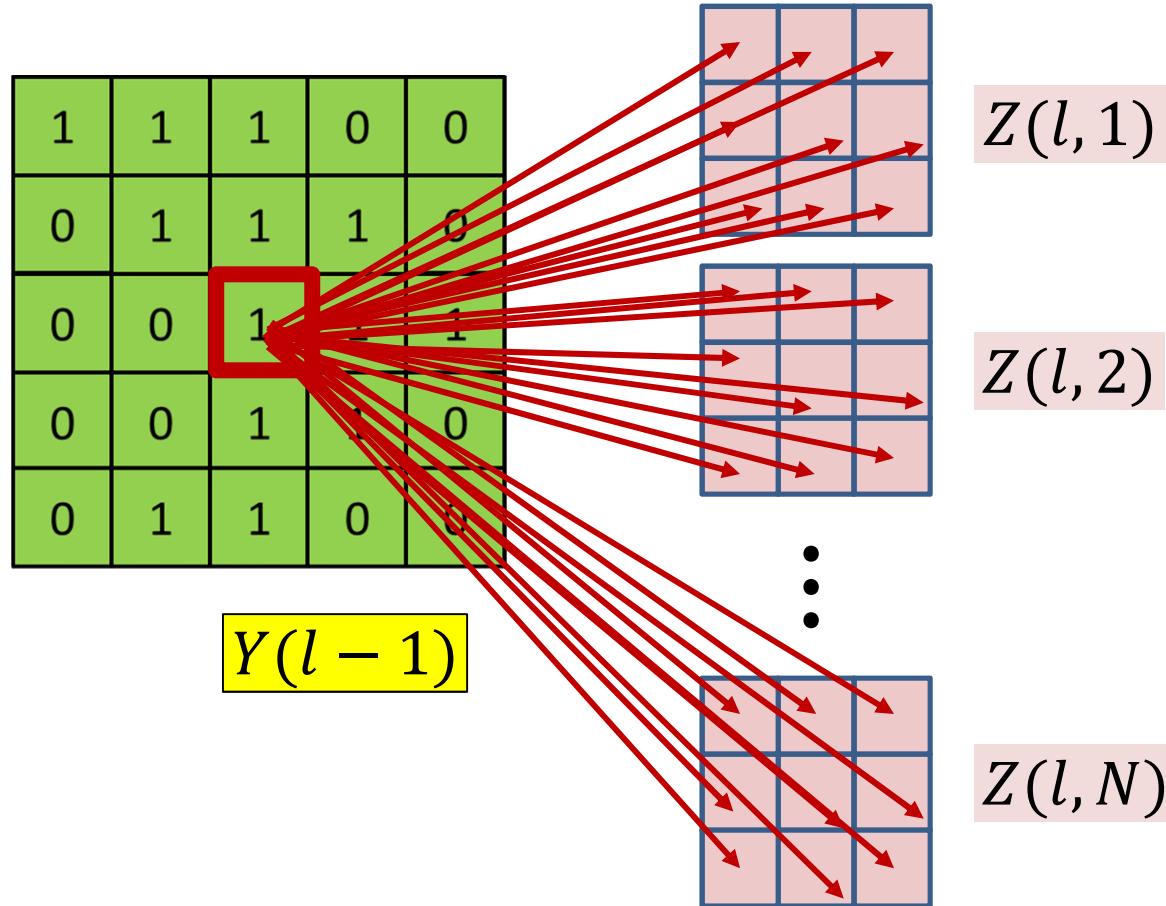

- For every l^{th} layer filter, each $Y(l - 1, m, x, y)$ affects several $z(l, n, x', y')$ terms
 - Through $w_l(m, n, x - x', y - y')$

BP: Convolutional layer

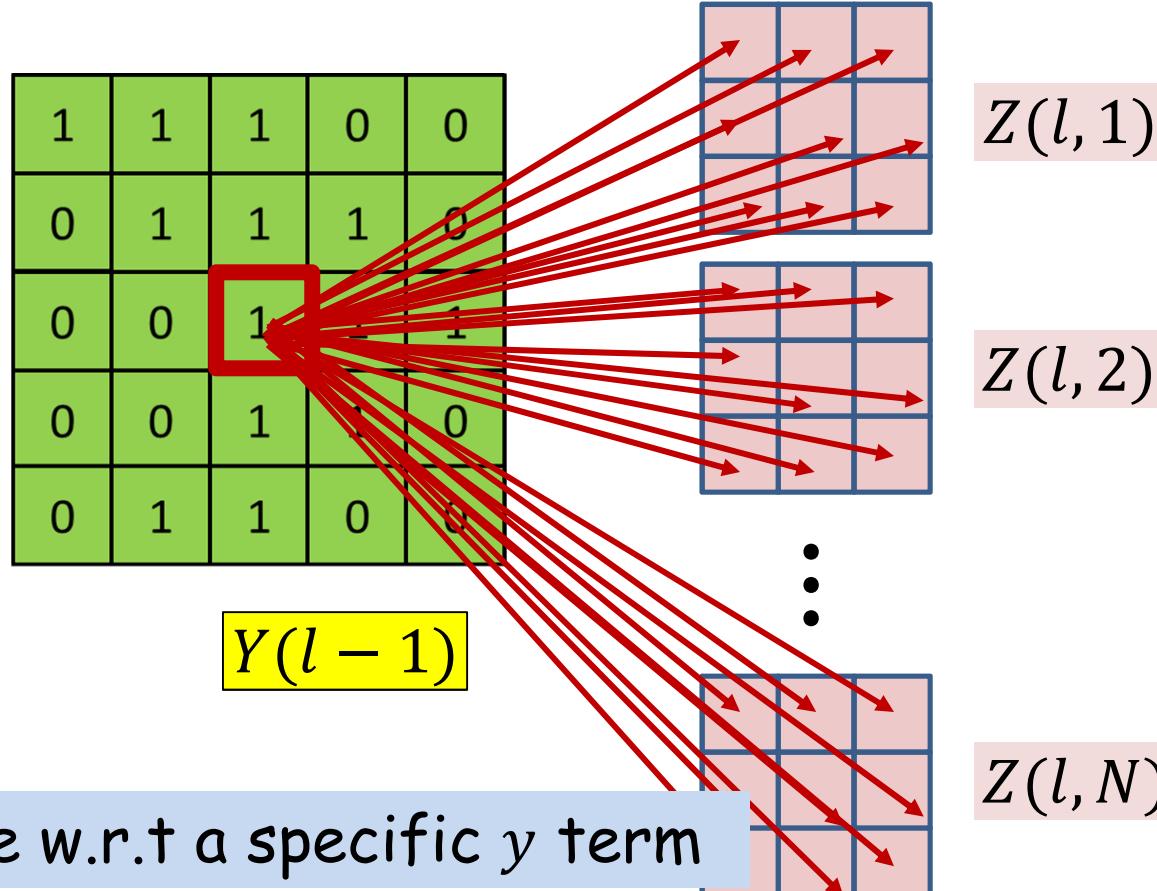

- For every l^{th} layer filter, each $Y(l - 1, m, x, y)$ affects several $z(l, n, x', y')$ terms

BP: Convolutional layer

- Each $Y(l - 1, m, x, y)$ affects several $z(l, n, x', y')$ terms for every n
 - *Affects terms in all l^{th} layer Z maps*
 - *All of them contribute to the derivative of the divergence w.r.t. $Y(l - 1, m, x, y)$*

BP: Convolutional layer

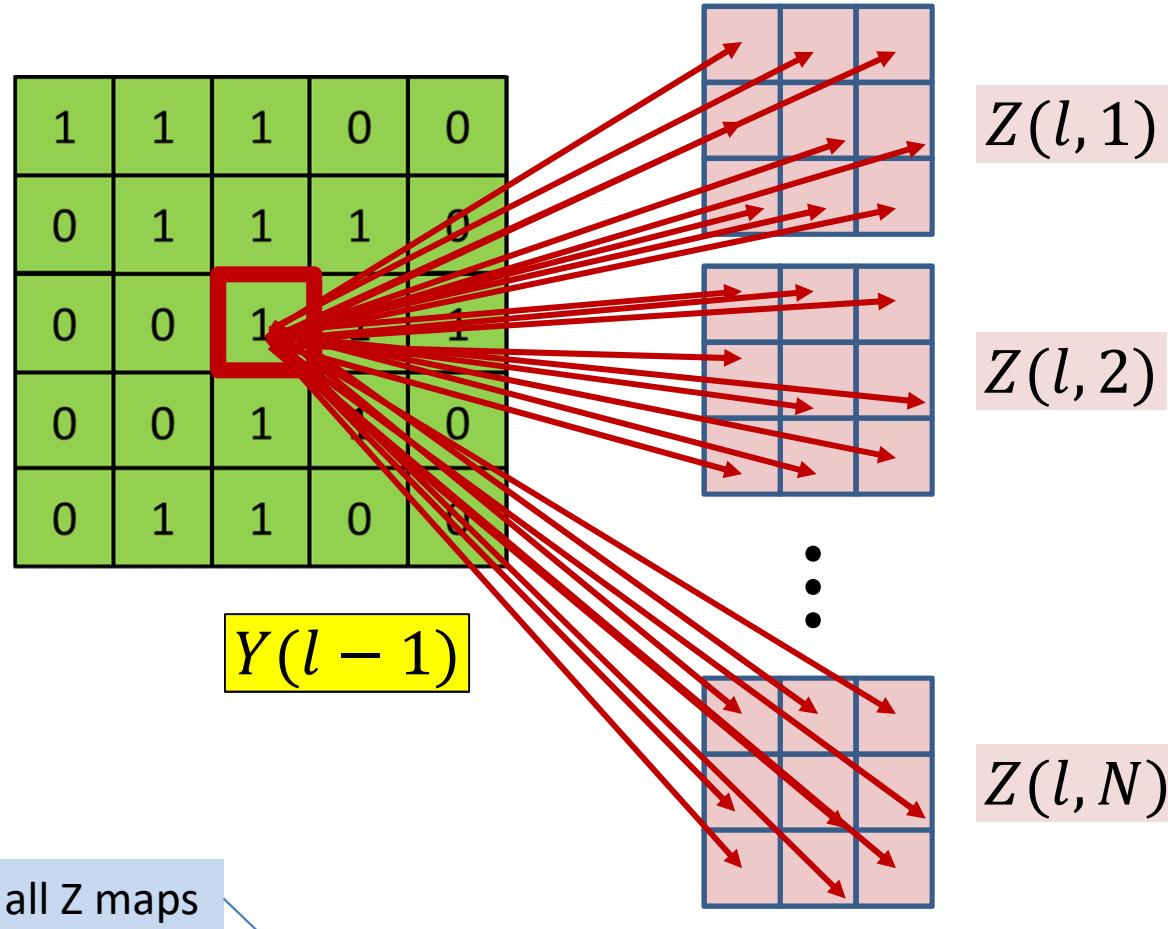

Derivative w.r.t a specific y term

$$\frac{dDiv}{dY(l-1, m, x, y)} = \sum_n \sum_{x',y'} \frac{dDiv}{dz(l, n, x', y')} \frac{dz(l, n, x', y')}{dY(l-1, m, x, y)}$$

$$= \sum_n \sum_{x',y'} \frac{dDiv}{dz(l, n, x', y')} w_l(m, n, x - x', y - y')$$

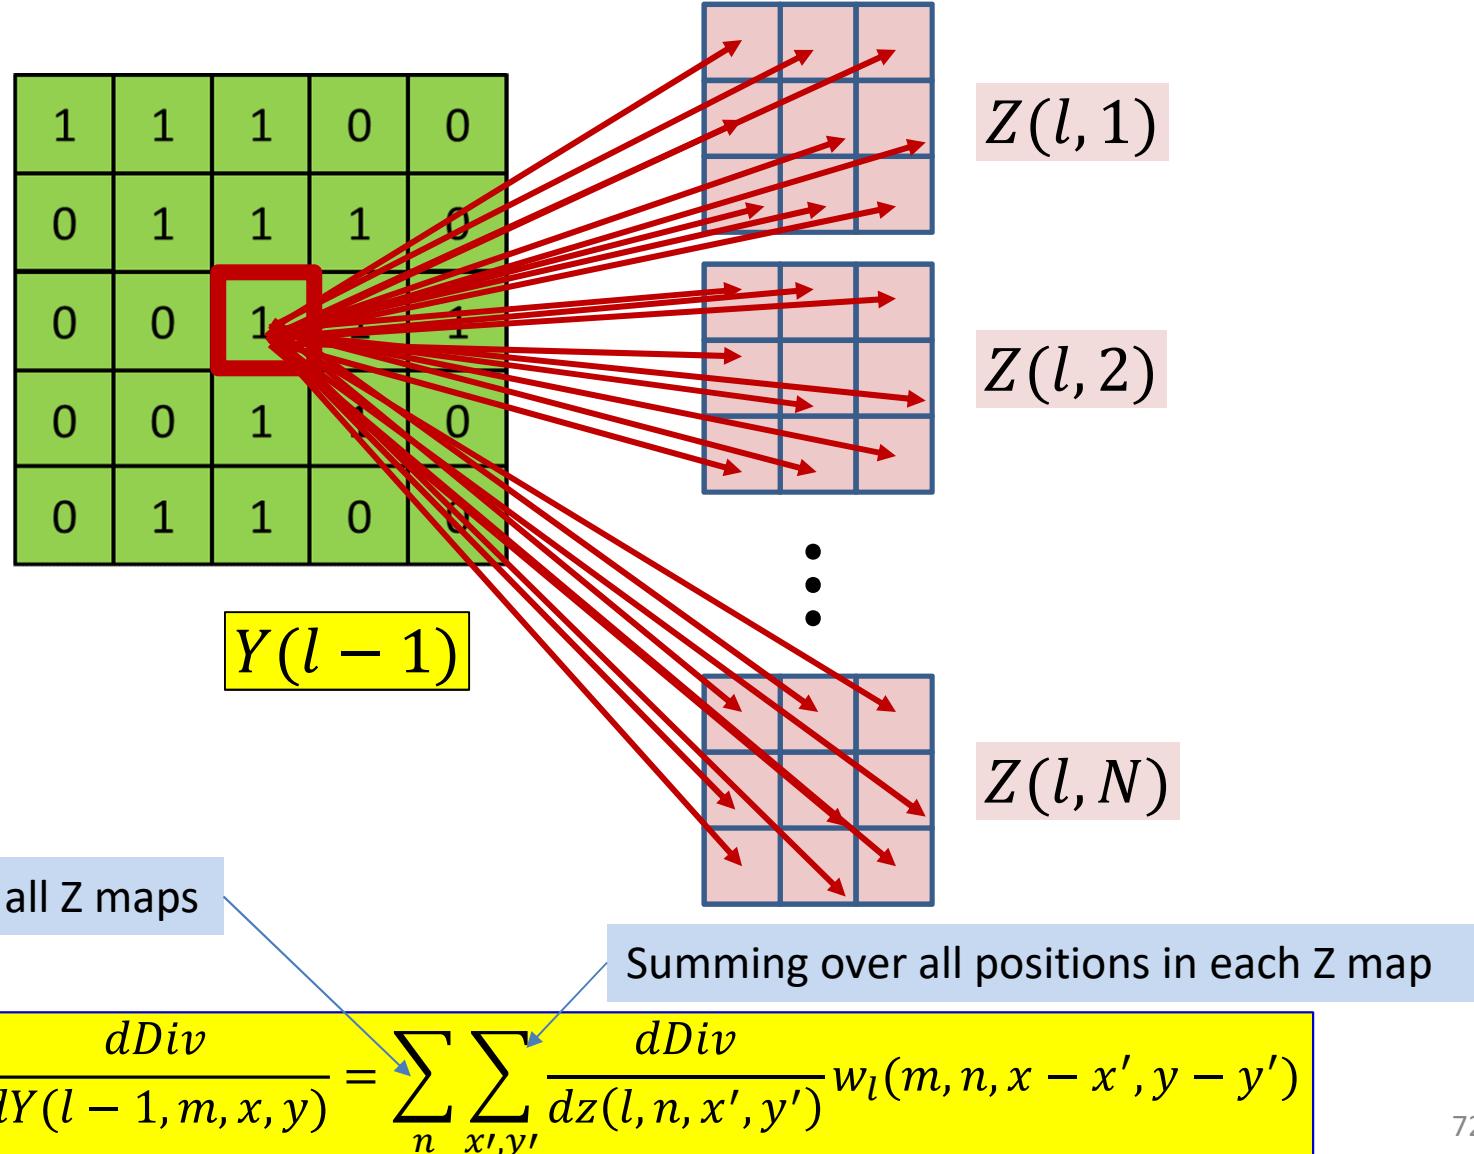

Assuming indexing
is from 0

BP: Convolutional layer

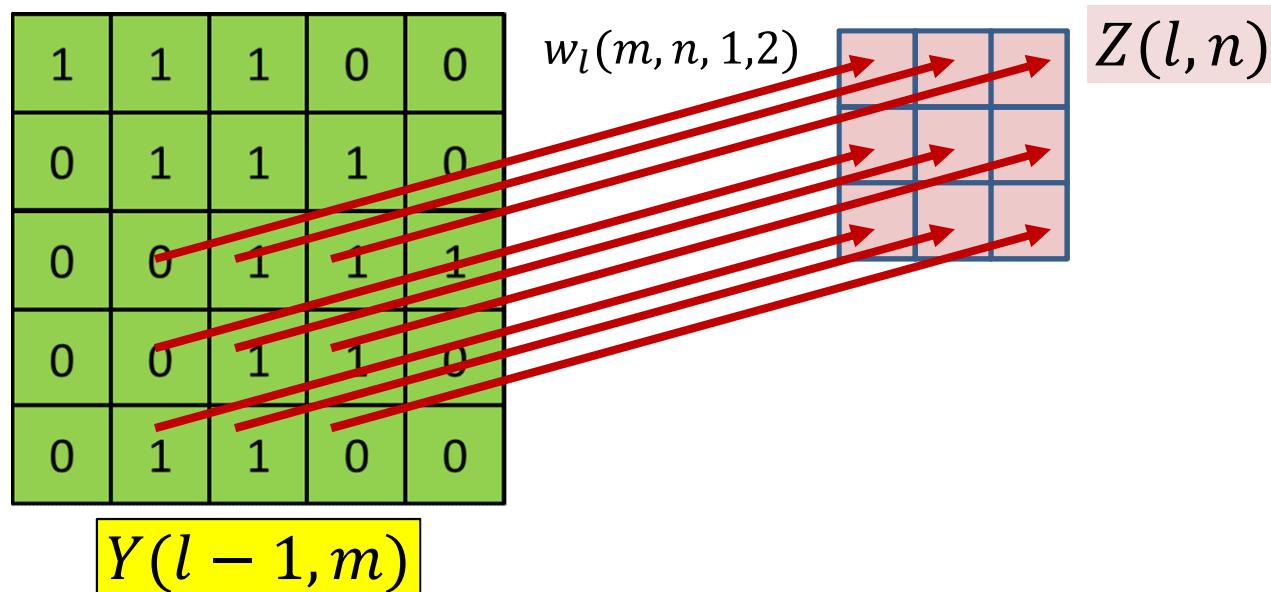

$$\frac{dDiv}{dY(l-1, m, x, y)} = \sum_n \sum_{x',y'} \frac{dDiv}{dz(l, n, x', y')} w_l(m, n, x - x', y - y')$$

BP: Convolutional layer

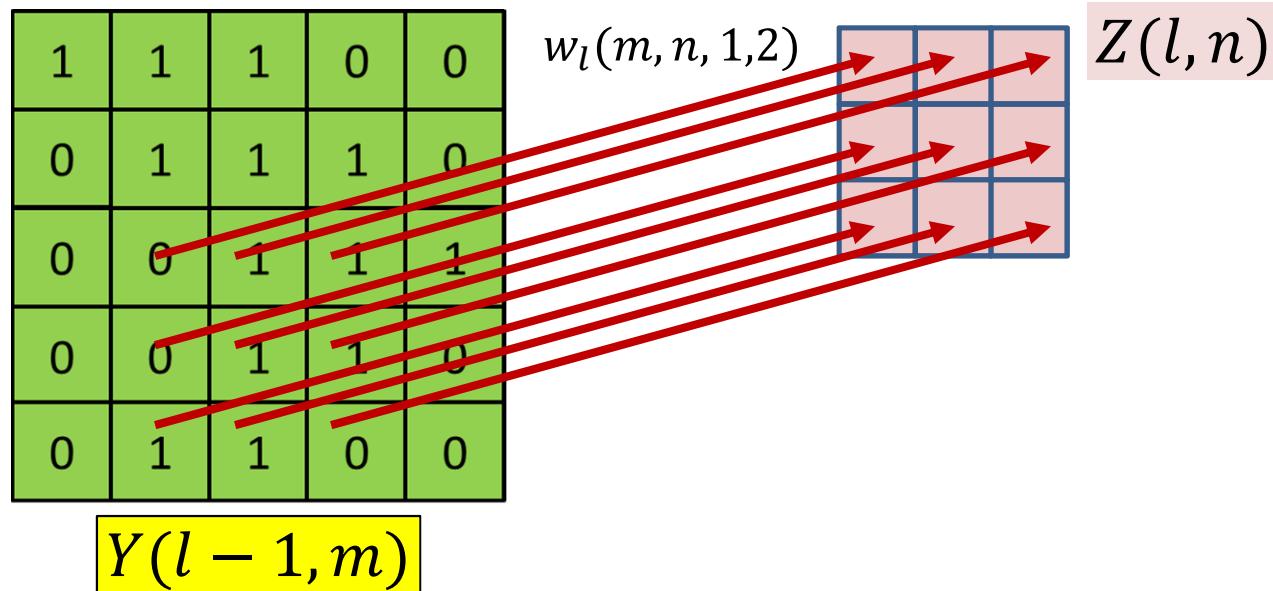

BP: Convolutional layer

- Each **weight** $w_l(m, n, x', y')$ also affects several $z(l, n, x, y)$ terms for every n
 - *Affects terms in only one Z map (the nth map)*
 - *All entries in the map contribute to the derivative of the divergence w.r.t. $w_l(m, n, x', y')$*

BP: Convolutional layer

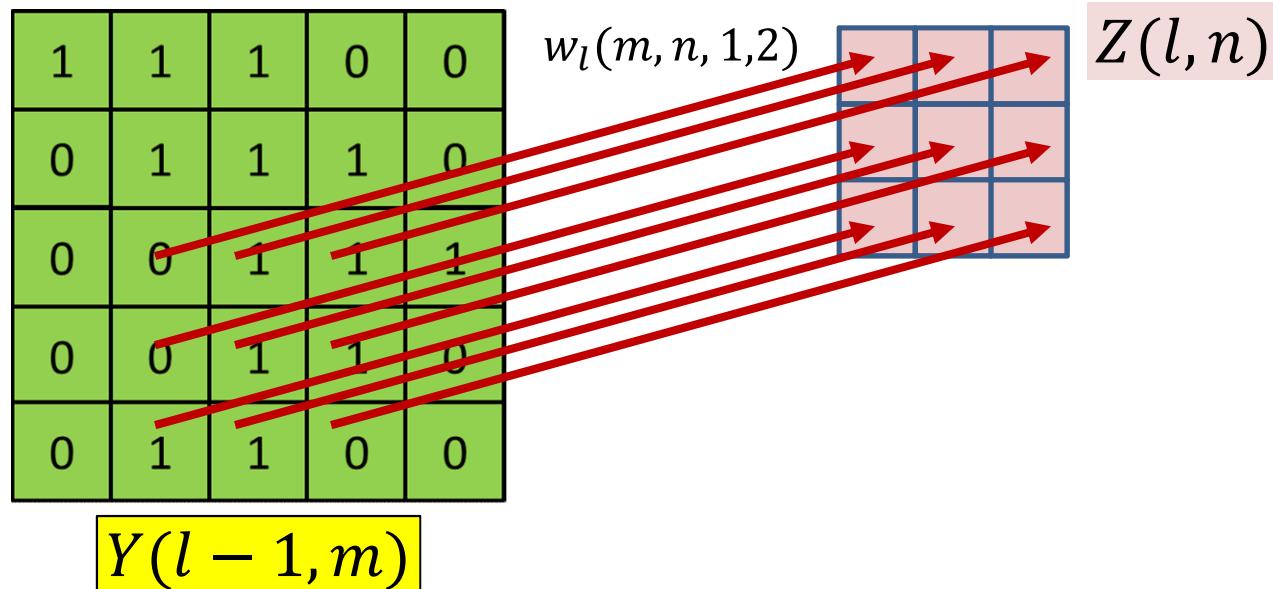

Derivative w.r.t a specific w term

$$\frac{dDiv}{dw_l(m, n, x, y)} = \sum_{x', y'} \frac{dDiv}{dz(l, n, x', y')} \frac{dz(l, n, x', y')}{dw_l(m, n, x, y)}$$

$$= \sum_{x', y'} \frac{dDiv}{dz(l, n, x', y')} Y(l - 1, m, x' + x, y' + y)$$

Assuming indexing
is from 0

BP: Convolutional layer

Summing over all (z, Y) pairs that are related multiplicatively by the weight

$$\frac{dDiv}{dw_l(m, n, x, y)} = \sum_{x', y'} \frac{dDiv}{dz(l, n, x', y')} Y(l - 1, m, x' + x, y' + y)$$

CNN: Forward

```
Y(0,:,:,:, :) = Image
for l = 1:L  # layers operate on vector at (x,y)
    for j = 1:Dl
        for x = 1:W-K+1
            for y = 1:H-K+1
                z(l,j,x,y) = 0
                for i = 1:Dl-1
                    for x' = 1:Kl
                        for y' = 1:Kl
                            z(l,j,x,y) += w(l,j,i,x',y')
                            Y(l-1,i,x+x'-1,y+y'-1)
                Y(l,j,x,y) = activation(z(l,j,x,y))
```

Switching to 1-based
indexing with appropriate
adjustments

```
Y = softmax( Y(L,: ,1,1) .. Y(L,: ,W-K+1,H-K+1) )
```

Backward layer l

```
dw(l) = zeros(DlxDl-1xKlxKl)
dY(l-1) = zeros(Dl-1xWl-1xHl-1)
for j = 1:Dl
    for x = 1:Wl-1-Kl+1
        for y = 1:Hl-1-Kl+1
            dz(l,j,x,y) = dY(l,j,x,y).f'(z(l,j,x,y))
            for i = 1:Dl-1
                for x' = 1:Kl
                    for y' = 1:Kl
                        dY(l-1,i,x+x'-1,y+y'-1) +=
                            w(l,j,i,x',y')dz(l,j,x,y)
                        dw(l,j,i,x',y') +=
                            dz(l,j,x,y)Y(l-1,i,x+x'-1,y+y'-1)
```

Backward layer l

```
dw(l) = zeros(DlxDl-1xKlxKl)
dY(l-1) = zeros(Dl-1xWl-1xHl-1)
for j = 1:Dl
    for x = 1:Wl-1-Kl+1
        for y = 1:Hl-1-Kl+1
            dz(l,j,x,y) = dY(l,j,x,y).f'(z(l,j,x,y))
            for i = 1:Dl-1
                for x' = 1:Kl
                    for y' = 1:Kl
                        dY(l-1,i,x+x'-1,y+y'-1) +=
                            w(l,j,i,x',y')dz(l,j,x,y)
                        dw(l,j,i,x',y') +=

$$\frac{\partial \text{Div}}{\partial y(l - 1, m, x, y)} = \sum_n \sum_{x', y'} \frac{d\text{Div}}{dz(l, n, x - x', y - y')} w_l(m, n, x', y')$$

- Lets see the derivative maps..

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = \frac{\partial \text{Div}}{\partial z(l, n, x', y')} w_l(m, n, *, *)$$

$w_l(m, n, *, *)$

$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$

• Flip up down
 flip left right
 of $w_l(m, n, *, *)$

$w_l(m, n, *, *)$

$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = \sum_n \sum_{x', y'} \frac{d\text{Div}}{dz(l, n, x - x', y - y')} w_l(m, n, x', y')$

- The derivative (w.r.t) y at (x, y) is obtained by *flipping the filter left-right, top-bottom, and computing the inner product with respect to the square patch of $\frac{\partial \text{Div}}{\partial z}$ ending at (x, y)*
 - This would be for *any* (x, y)

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel $w_l(m, n, *, *)$. The input grid has a width of m and height n , with the first column colored orange. The output grid has a width of l and height n , with the first column colored pink. The kernel w_l is a 3x3 matrix with the following values:

Pink	Brown	Green
Blue	Yellow	Light Green
Green	Pink	Red

The result of the multiplication is shown as a 3x3 grid where each element is the sum of the products of the corresponding elements from the input row and the kernel column. The first element of the result grid is pink, indicating it is the result of the derivative computation.

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. A 5x5 input grid is multiplied by a 3x3 weight kernel $w_l(m, n, *, *)$ to produce a 3x3 output grid.

The input grid (left) has values:

orange	orange	yellow	yellow	yellow
white	white	white	white	white
white	white	white	white	white
white	white	white	white	white
white	white	white	white	white

The weight kernel $w_l(m, n, *, *)$ (top) has values:

pink	brown	green
blue	yellow	light green
olive	pink	red

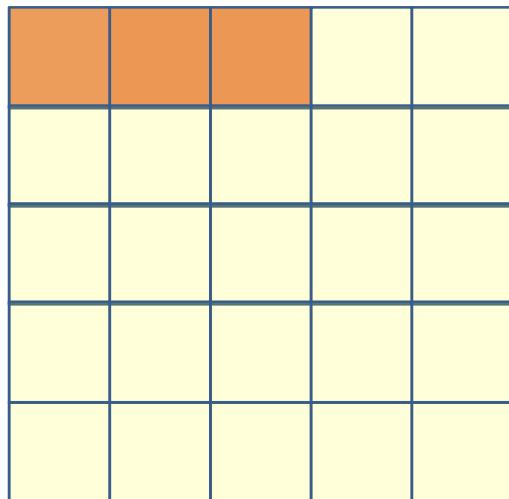

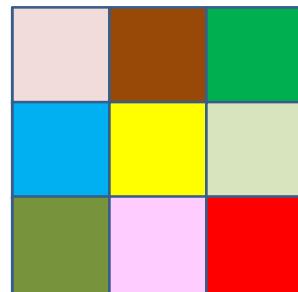

The resulting output grid (right) has values:

red	pink	olive
light green	yellow	blue
green	brown	pink

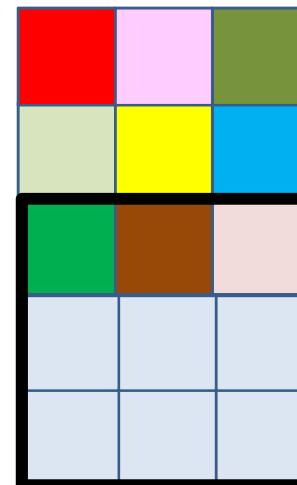

A black box highlights the central element of the weight kernel, which corresponds to the central element of the output grid.

Computing the derivative

$w_l(m, n, *, *)$

=

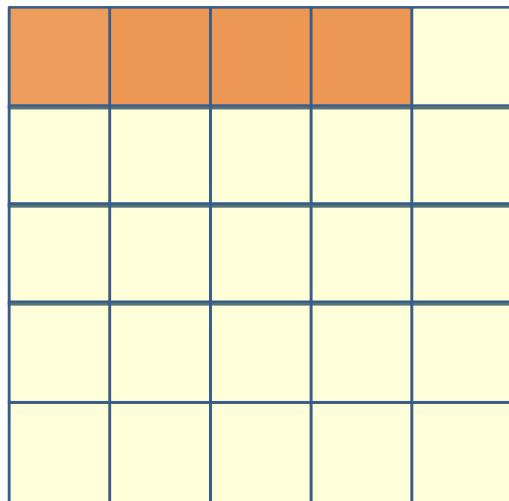

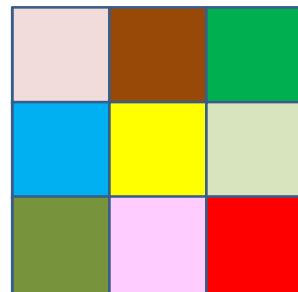

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

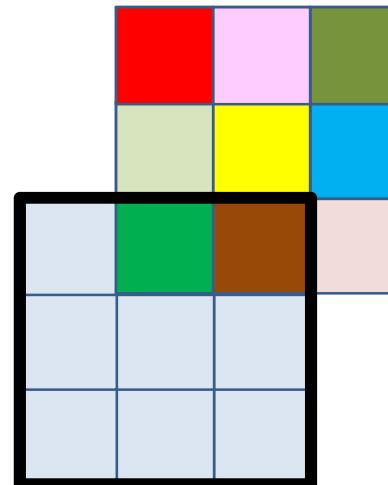

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$w_l(m, n, *, *)$$

=

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \text{Input} - \text{Output}$$

The diagram illustrates the computation of a derivative using a convolutional kernel $w_l(m, n, *, *)$. The input is a 5x5 grid of yellow squares. The output is a 3x3 grid where the last row is highlighted with a black border. The kernel w_l is a 3x3 grid with the following colors:

Pink	Brown	Green
Blue	Yellow	Light Green
Green	Pink	Red

The output grid shows the result of applying this kernel to the input grid, with the last row being the result of the derivative computation.

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. A large input grid of size $(l-1) \times n$ is multiplied by a smaller kernel $w_l(m, n, *, *)$ of size $m \times n$. The result is a derivative grid of size $l \times n$.

The kernel $w_l(m, n, *, *)$ is a 3x3 matrix:

Pink	Brown	Green
Blue	Yellow	Light Green
Green	Pink	Red

The input grid has a highlighted column at position $l-1$:

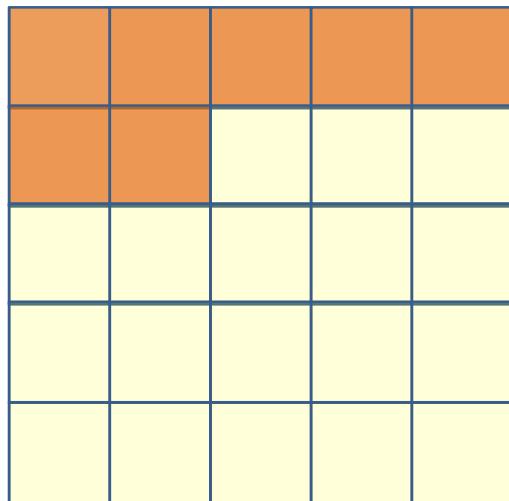

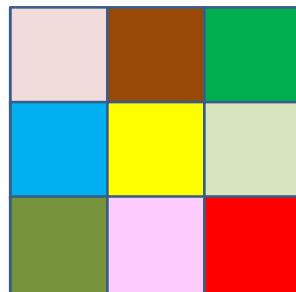

Orange	Orange	Orange	Orange	Orange
Orange	Yellow	Yellow	Yellow	Yellow
Yellow	Yellow	Yellow	Yellow	Yellow
Yellow	Yellow	Yellow	Yellow	Yellow
Yellow	Yellow	Yellow	Yellow	Yellow

The output derivative grid has a highlighted column at position n :

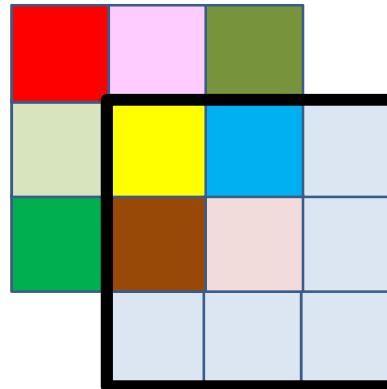

Red	Pink	Green	Yellow	Blue	Light Blue	Light Blue	Light Blue
Light Green	Yellow	Blue	Light Blue	Light Blue	Light Blue	Light Blue	Light Blue
Green	Brown	Pink	Light Blue				

Computing the derivative

$w_l(m, n, *, *)$

=

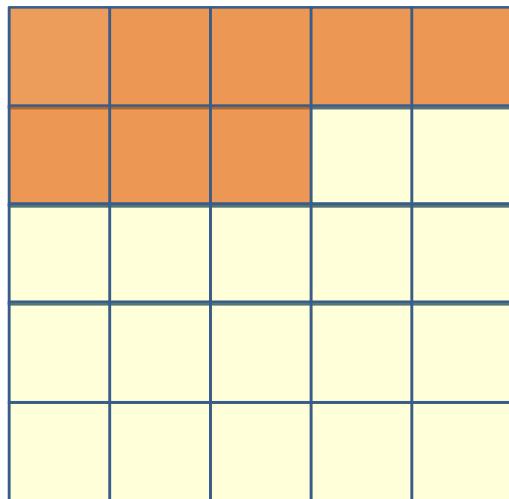

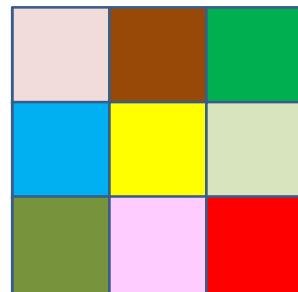

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

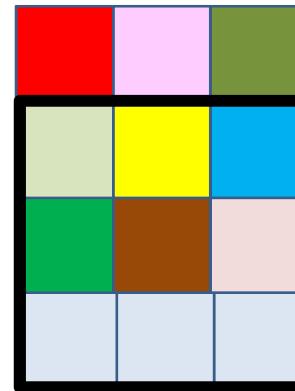

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$w_l(m, n, *, *)$$

=

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

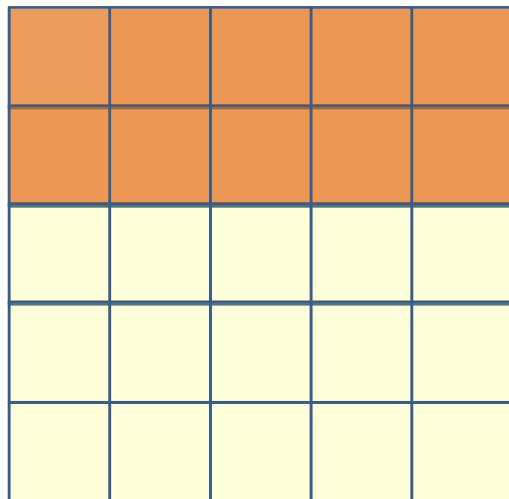

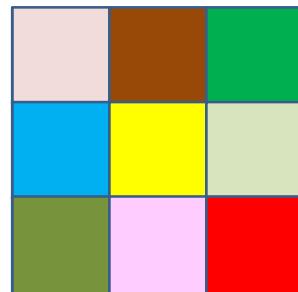

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid is shown with alternating orange and yellow cells. A 3x3 kernel, labeled $w_l(m, n, *, *)$, is applied to the input. The result is a 3x3 output grid where each cell's color corresponds to the result of the convolution operation. The output grid has a black border around its central 3x3 area, which is highlighted with a black box.

The input grid is a 5x5 matrix of alternating orange and yellow cells. The kernel is a 3x3 matrix with the following colors:
Row 1: Light pink, Brown, Green
Row 2: Blue, Yellow, Light green
Row 3: Olive green, Light pink, Red

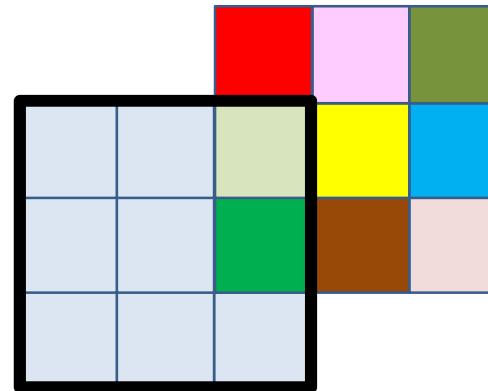

The output grid is a 3x3 matrix with the following colors:
Row 1: Red, Light pink, Olive green
Row 2: Light blue, Green, Brown
Row 3: Light blue, White, Light pink

Computing the derivative

$$w_l(m, n, *, *)$$

=

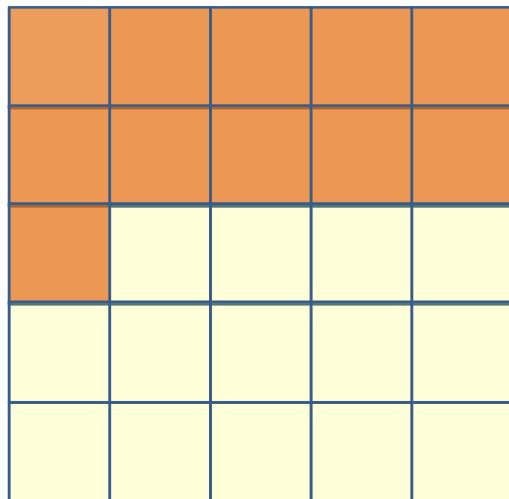

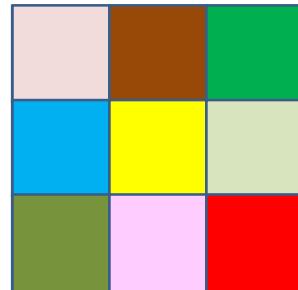

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

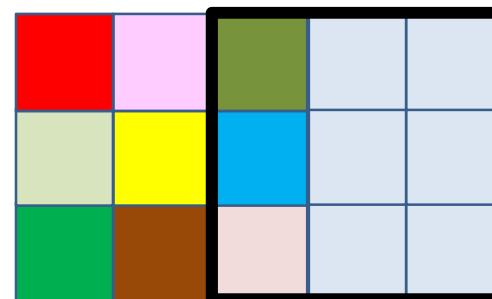

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$w_l(m, n, *, *)$$

=

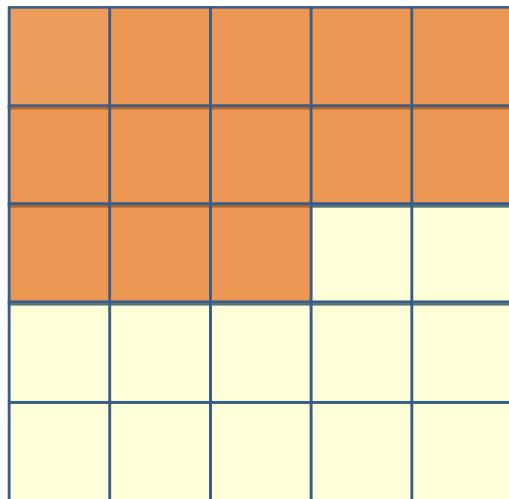

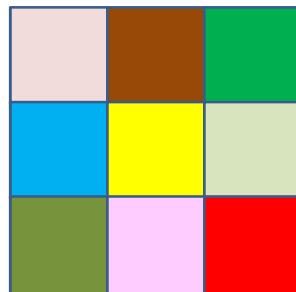

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

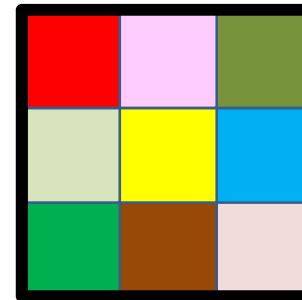

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$w_l(m, n, *, *)$$

=

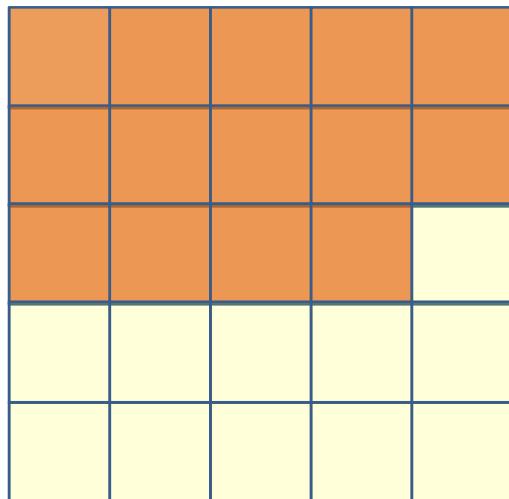

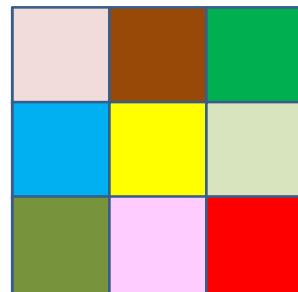

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

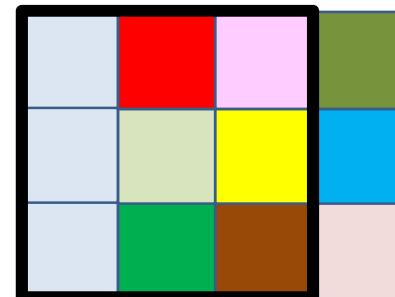

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$w_l(m, n, *, *)$$

=

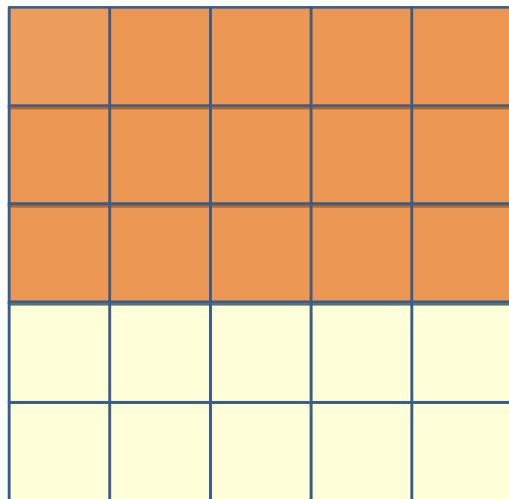

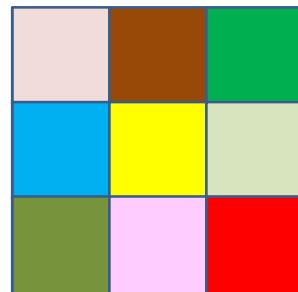

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

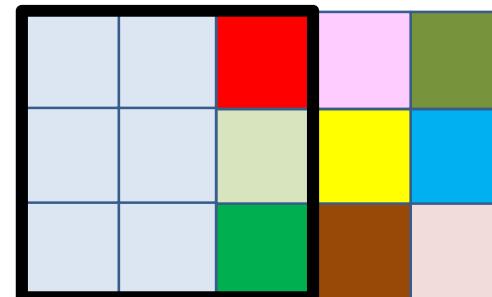

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$w_l(m, n, *, *)$$

=

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$$

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid is shown with alternating orange and yellow cells. In the center, an equals sign separates the input from the result. On the right, the result is shown as a 3x3 grid where each cell's color corresponds to the result of applying the kernel $w_l(m, n, *, *)$ to the input. A black border surrounds the central 3x3 result, indicating the receptive field of that output unit. The kernel itself is a 3x3 matrix with the following colors:

Pink	Brown	Green
Blue	Yellow	Light Green
Dark Green	Pink	Red

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid is shown with alternating orange and yellow cells. In the center, a 3x3 kernel $w_l(m, n, *, *)$ is applied to a 3x3 receptive field in the input grid, highlighted by a black border. The kernel values are: Row 1: light pink, brown, green; Row 2: blue, yellow, light green; Row 3: olive green, pink, red. The result of the multiplication is shown on the right, where the central 3x3 area of the input grid has been updated according to the kernel's weights.

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = \text{w}_l(m, n, *, *)$$

The diagram illustrates the computation of a derivative using a convolutional kernel (w_l) and input data. On the left, there is a 5x5 input grid with orange and yellow cells. In the middle, there is an equals sign (=). To the right of the equals sign is a 3x3 kernel (w_l) with various colored cells (pink, brown, green, blue, yellow, light green, olive, red, pink, yellow, red, blue, green, brown, pink). Below the equals sign is a 3x3 output grid with red, pink, light green, yellow, blue, and green cells. This output grid is enclosed in a black border, indicating it is the result of applying the kernel to the input grid.

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = \text{w}_l(m, n, *, *)$$

The diagram illustrates the computation of a derivative using a convolutional kernel (weight matrix) and an input feature map.

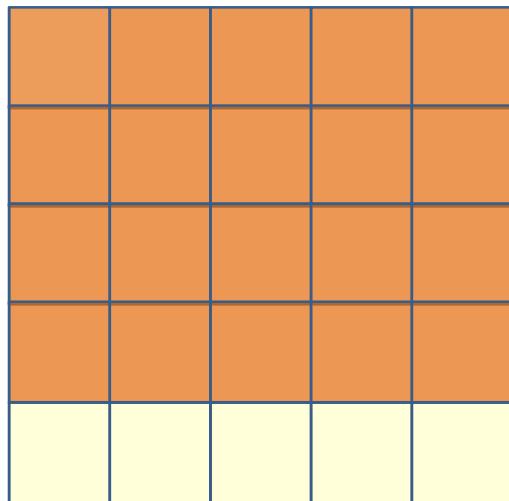

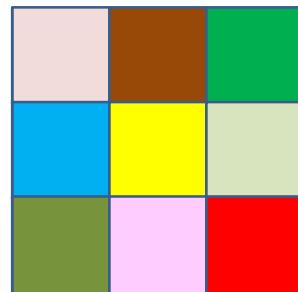

The input feature map (bottom left) is a 5x5 grid of orange squares. The output feature map (bottom right) is a 3x3 grid of colored squares: light blue, red, pink, light green, yellow, blue, green, brown, and light pink. A black border surrounds the 3x3 output feature map.

The weight matrix (top right) is a 3x3 grid of colored squares: light pink, brown, green; blue, yellow, light green; olive green, pink, red. It is labeled $w_l(m, n, *, *)$.

The equation shows the result of applying the weight matrix to the input feature map, resulting in the output feature map.

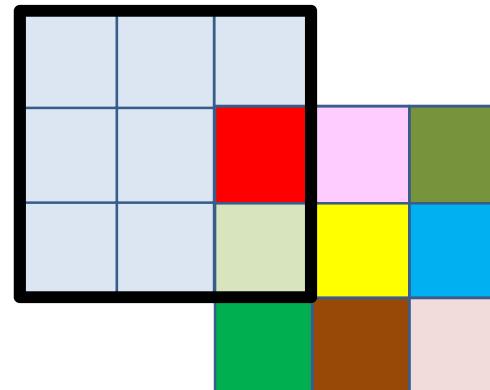

Computing the derivative

$$w_l(m, n, *, *)$$

=

$$\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

$$\frac{\partial \text{Div}}{\partial y(l - 1, m, x, y)}$$

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid of orange squares is shown. In the bottom-left corner, the first square is orange, while the remaining four squares in that row and column are yellow. This represents a partial derivative of the input feature map with respect to the output channel. To the right of the input grid is an equals sign. Above the equals sign is a 3x3 kernel labeled $w_l(m, n, *, *)$, containing colored squares: top row (light pink, brown, green), middle row (blue, yellow, light green), and bottom row (olive green, pink, red). Below the equals sign is a 3x3 output grid. The central square of this grid is highlighted with a black border. The colors of the other squares in the output grid correspond to the weighted sum of the kernel and the input window centered on the highlighted output unit. Specifically, the output grid shows: top row (light blue, light blue, light blue), middle row (red, pink, olive green), and bottom row (green, brown, light pink).

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid of orange squares is shown. In the bottom-right corner, four squares are highlighted in light yellow. To the right of the input grid is an equals sign. Above the equals sign is a 3x3 kernel labeled $w_l(m, n, *, *)$, containing colored squares: top row (light pink, brown, green), middle row (blue, yellow, light green), and bottom row (olive green, pink, red). Below the equals sign is a 3x3 output grid where the bottom-right 2x2 subgrid (the receptive field of the highlighted input squares) is highlighted with a black border. This output grid is labeled $\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$. Below the output grid is another 3x3 grid, also with its bottom-right 2x2 subgrid highlighted with a black border. This grid is labeled $\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)}$. The colors in the grids correspond to the kernel values: blue for 1, yellow for 2, light green for 3, olive green for 4, pink for 5, brown for 6, and red for 7.

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid of orange squares is shown. A 3x3 kernel, labeled $w_l(m, n, *, *)$, is applied to a 3x3 receptive field in the bottom-right corner of the input. This receptive field is highlighted with colored squares (pink, brown, green, yellow, light green, red, olive, light pink, cyan) corresponding to the kernel's weights. The result of the multiplication is a 3x3 output grid where the bottom-right square is colored according to the kernel's weights. This output grid is labeled $\frac{\partial \text{Div}}{\partial z(l, n, x', y')}$.

Computing the derivative

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = w_l(m, n, *, *) \cdot \frac{\partial \text{Div}}{\partial z(l, n, x', y')}$$

The diagram illustrates the computation of a derivative using a convolutional kernel. On the left, a 5x5 input grid of orange squares is shown. A 3x3 kernel, labeled $w_l(m, n, *, *)$, is applied to this input. The result is a 3x3 output grid where the bottom-right square is yellow, indicating the result of the derivative computation. The other squares in the output grid are light blue, representing padding or intermediate values.

The kernel $w_l(m, n, *, *)$ is a 3x3 matrix with the following colors:

Pink	Brown	Green
Blue	Yellow	Light Green
Green	Pink	Red

The output grid is a 3x3 matrix with the following colors:

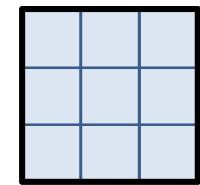

Light Blue	Light Blue	Light Blue
Light Blue	Yellow	Pink
Light Blue	Green	Blue

Computing the derivative

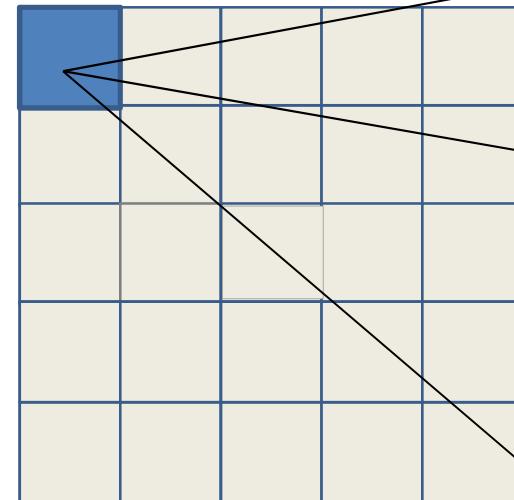

$$\frac{\partial \text{Div}}{\partial y(l-1, m, x, y)} = \text{w}_l(m, n, *, *)$$

The diagram illustrates the computation of a derivative using a convolutional kernel (weight matrix) and an input feature map. The input feature map is a 5x5 grid of orange squares. The weight matrix $w_l(m, n, *, *)$ is a 3x3 grid of colored squares: top-left (pink), top-middle (brown), top-right (green); middle-left (blue), middle-middle (yellow), middle-right (light green); bottom-left (olive), bottom-middle (pink), bottom-right (red). A black border surrounds the 3x3 kernel. The result of the convolution is a 3x3 grid of colored squares: top-left (light blue), top-middle (light blue), top-right (light blue); middle-left (light blue), middle-middle (red), middle-right (pink); bottom-left (green), bottom-middle (yellow), bottom-right (blue).

Pooling and downsampling

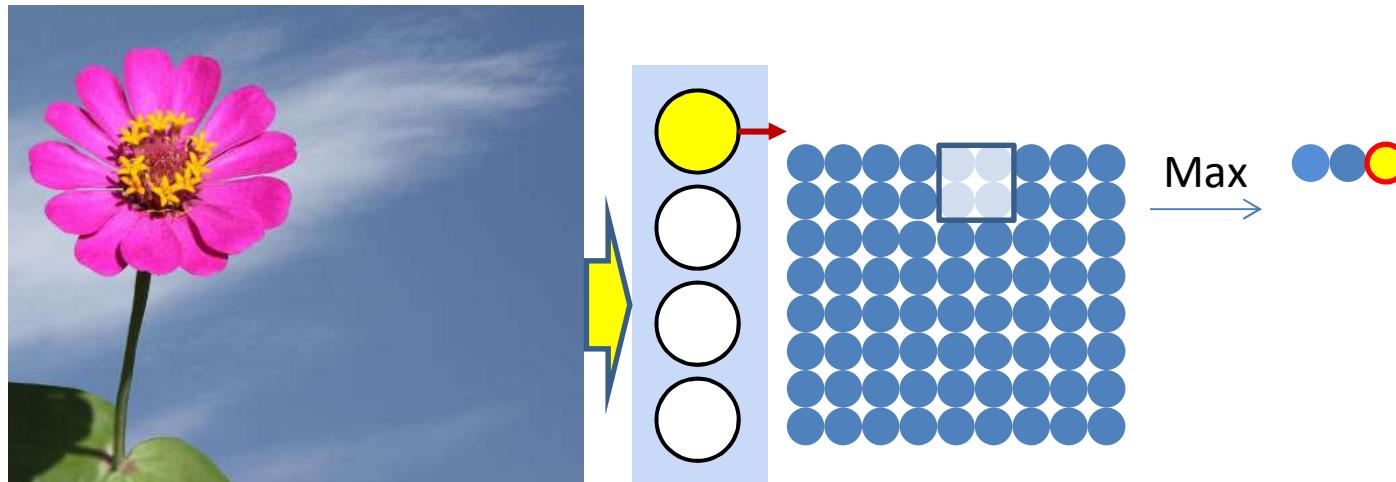

- Pooling is typically performed with strides > 1
 - Results in shrinking of the map
 - “Downsampling”

Max pooling

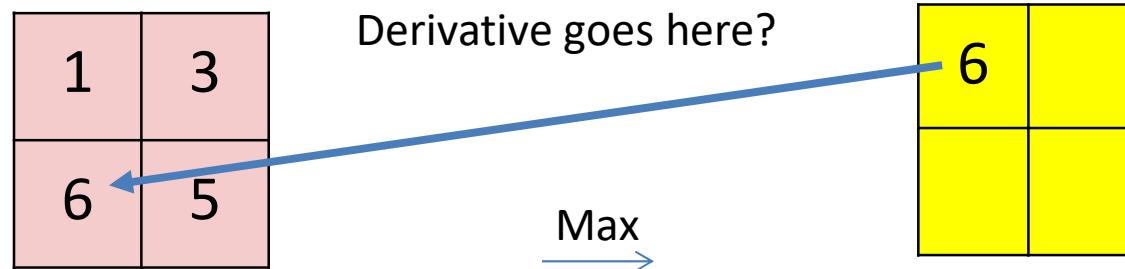

- Max pooling selects the largest from a pool of elements
- Pooling is performed by “scanning” the input

$$P(l, m, i, j) = \underset{\substack{k \in \{(i-1)d+1, (i-1)d+K_{lpool}\}, \\ n \in \{(j-1)d+1, (j-1)d+K_{lpool}\}}}{\operatorname{argmax}} Y(l, m, k, n)$$

$$U(l, m, i, j) = Y(l, m, P(l, m, i, j))$$

Derivative of Max pooling

$$\frac{dDiv}{dY(l, m, k, l)} = \begin{cases} \frac{dDiv}{dU(l, m, i, j)} & \text{if } (k, l) = P(l, m, i, j) \\ 0 & \text{otherwise} \end{cases}$$

- Max pooling selects the largest from a pool of elements
- Pooling is performed by “scanning” the input

$$P(l, m, i, j) = \operatorname{argmax}_{\substack{k \in \{(i-1)d+1, (i-1)d+K_{lpool}\}, \\ n \in \{(j-1)d+1, (j-1)d+K_{lpool}\}}} Y(l, m, k, n)$$

$$U(l, m, i, j) = Y(l, m, P(l, m, i, j))$$

Max Pooling layer at layer l

- a) Performed separately for every map (j).
*) Not combining multiple maps within a single max operation.
- b) Keeping track of location of max

Max pooling

```
for j = 1:D1
    m = 1
    for x = 1:stride(l):Wl-1-Kl+1
        n = 1
        for y = 1:stride(l):Hl-1-Kl+1
            pidx(l,j,m,n) = maxidx(y(l-1,j,x:x+Kl-1,y:y+Kl-1))
            u(l,j,m,n) = y(l-1,j,pidx(l,j,m,n))
            n = n+1
        m = m+1
```

Derivative of max pooling layer at layer l

- a) Performed separately for every map (j).
*) Not combining multiple maps within a single max operation.
- b) Keeping track of location of max

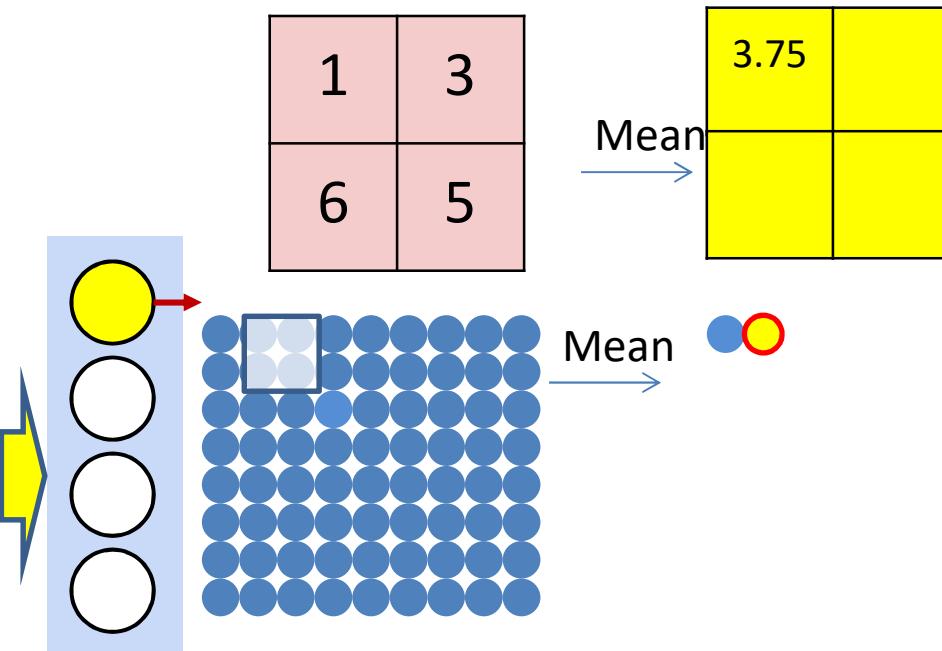

Max pooling

```
dy (:,:, :) = zeros (D1 x W1 x H1)
for j = 1:D1
    for x = 1:W1_downsampled
        for y = 1:H1_downsampled
            dy(l,j,pidx(l,j,x,y)) += u(l,j,x,y)
```

“ $+=$ ” because this entry may be selected in multiple adjacent overlapping windows

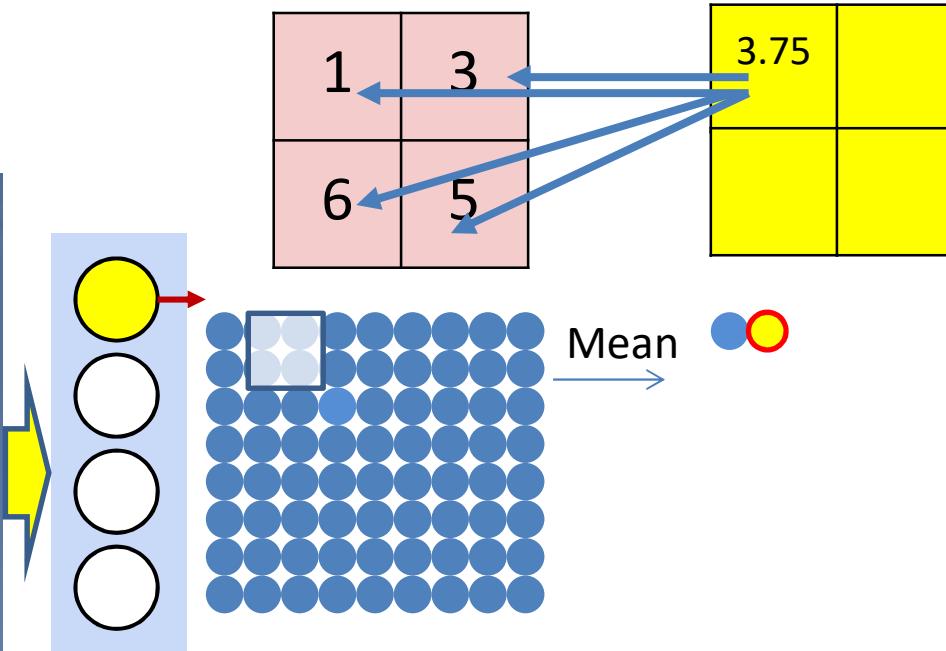

Mean pooling

- Mean pooling compute the mean of a pool of elements
- Pooling is performed by “scanning” the input

$$U(l, m, i, j) = \frac{1}{K_{lpool}^2} \sum_{\substack{k \in \{(i-1)d+1, (i-1)d+K_{lpool}\}, \\ n \in \{(j-1)d+1, (j-1)d+K_{lpool}\}}} y(l, m, k, n)$$

Derivative of mean pooling

- The derivative of mean pooling is distributed over the pool

$$k \in \{(i-1)d + 1, (i-1)d + K_{lpool}\}, \quad n \in \{(j-1)d + 1, (j-1)d + K_{lpool}\}$$
$$dy(l, m, k, n) = \frac{1}{K_{lpool}^2} du(l, m, k, n)$$

Mean Pooling layer at layer l

a) Performed separately for every map (j).

*) Not combining multiple maps within a single mean operation.

Mean pooling

```
for j = 1:D1 #Over the maps
    m = 1
    for x = 1:stride(l):Wl-1-Kl+1 #Kl = pooling kernel size
        n = 1
        for y = 1:stride(l):Hl-1-Kl+1
            u(l,j,m,n) = mean(y(l-1,j,x:x+Kl-1,y:y+Kl-1))
            n = n+1
        m = m+1
```

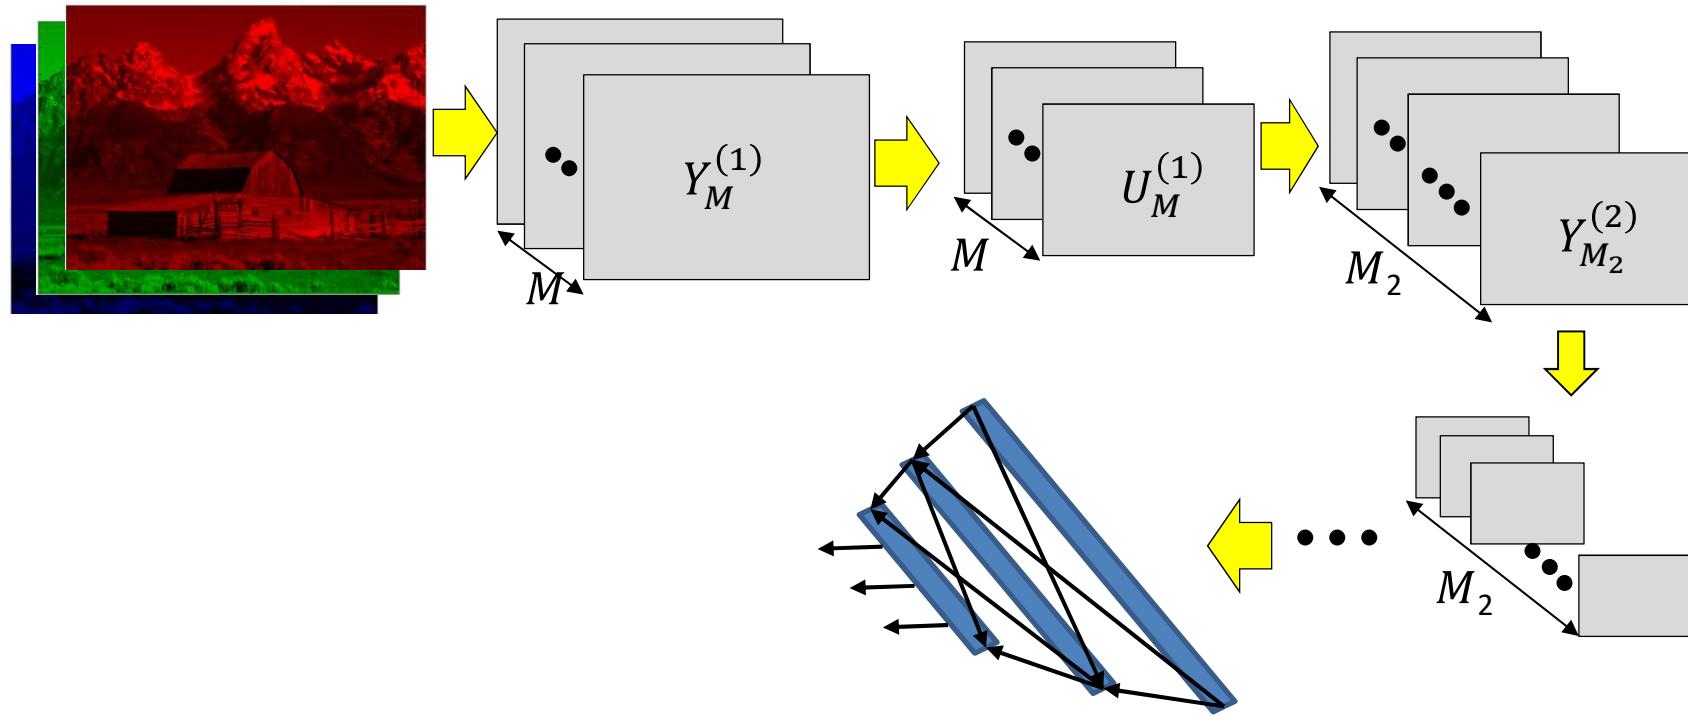

Derivative of mean pooling layer at layer l

Mean pooling

```
dy(:,:,:,:) = zeros(Dl x Wl x Hl)
for j = 1:Dl
    for x = 1:Wl_downsampled
        n = (x-1)*stride
        for y = 1:Hl_downsampled
            m = (y-1)*stride
            for i = 1:Klpool
                for j = 1:Klpool
                    dy(l,j,p,n+i,m+j) += (1/Klpool2) u(l,j,x,y)
```

“+=” because adjacent windows may overlap

Learning the network

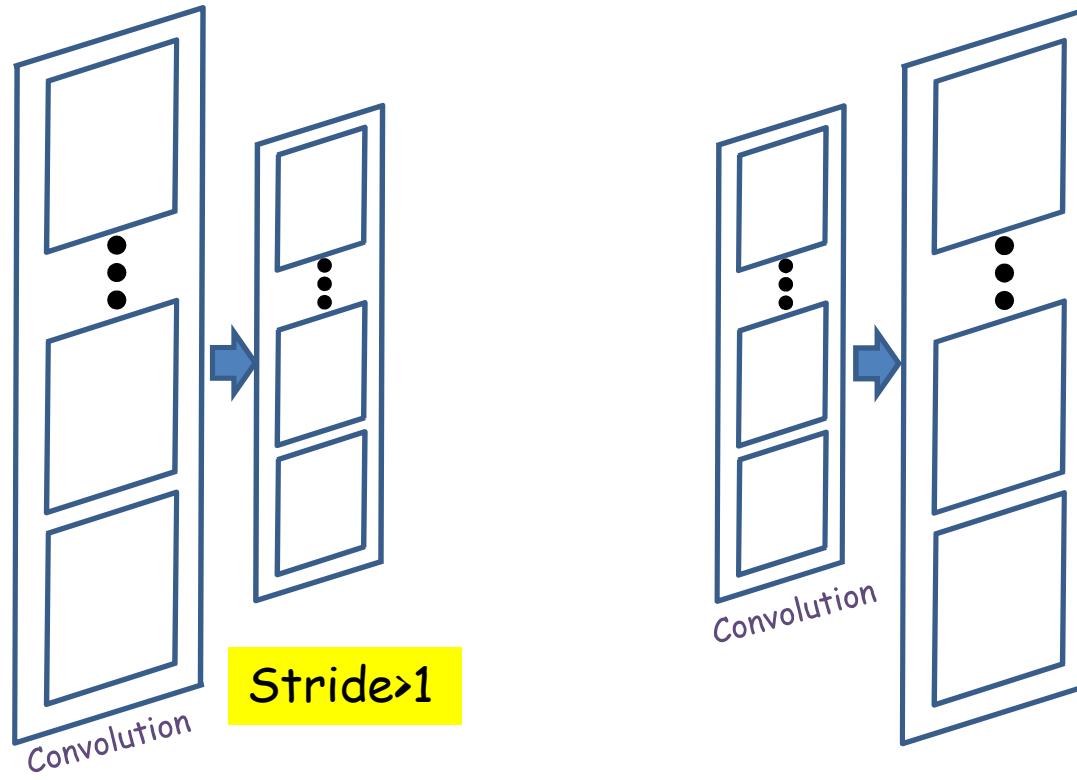

- Have shown the derivative of divergence w.r.t every intermediate output, and every free parameter (filter weights)
- Can now be embedded in gradient descent framework to learn the network

Story so far

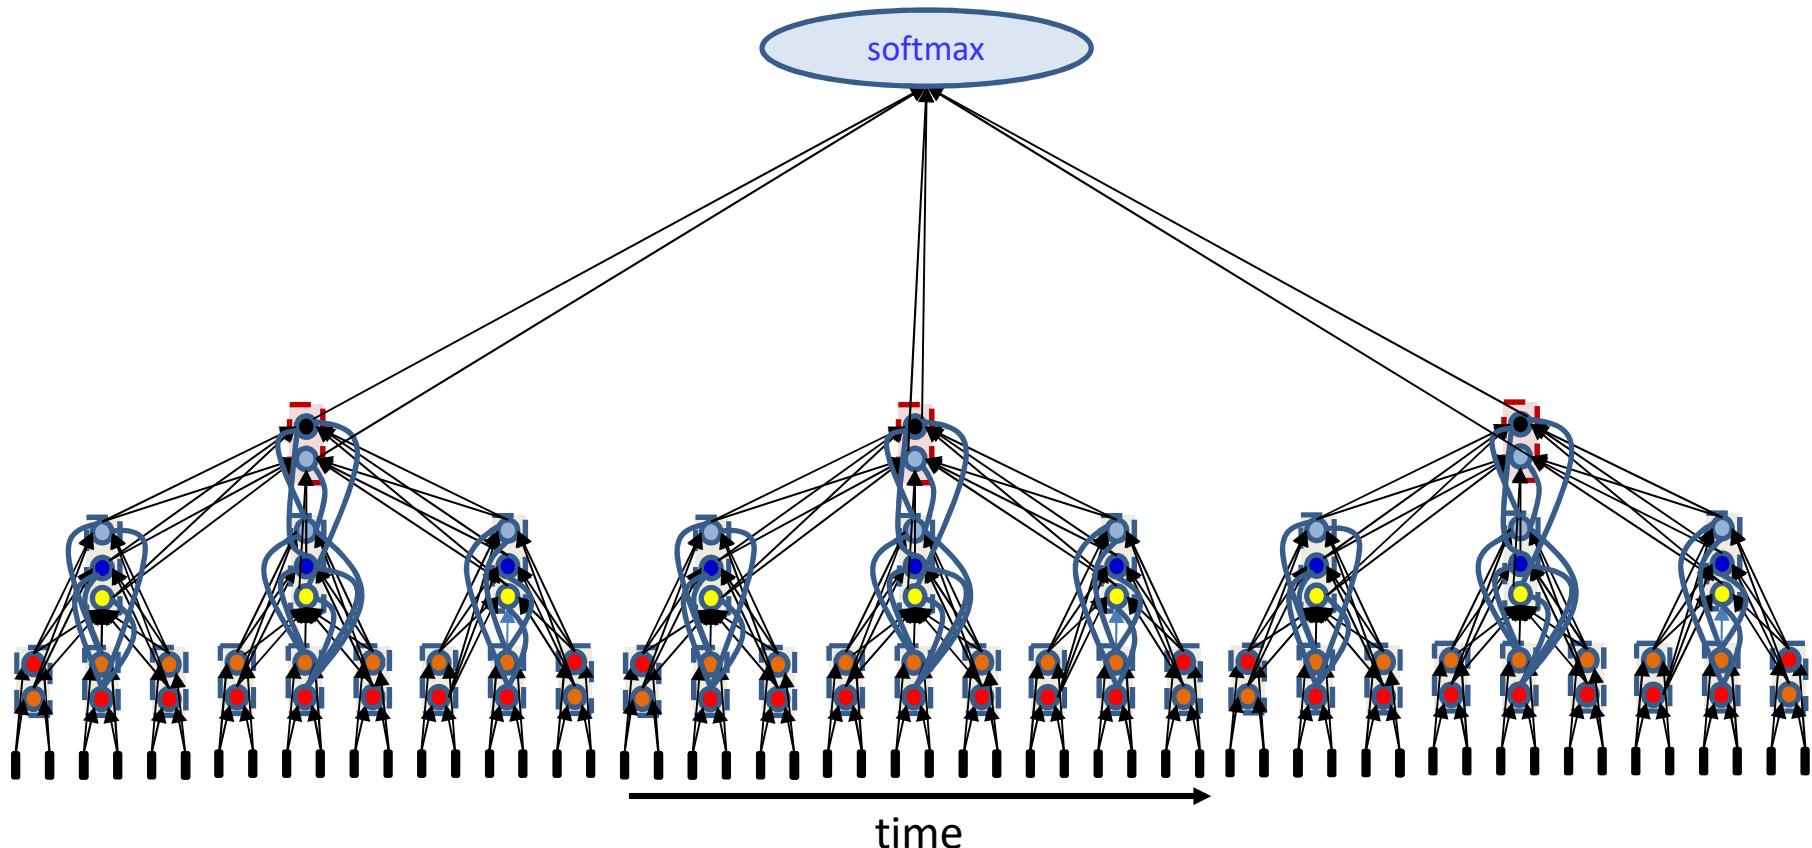

- The convolutional neural network is a supervised version of a computational model of mammalian vision
- It includes
 - Convolutional layers comprising learned filters that scan the outputs of the previous layer
 - Downsampling layers that operate over groups of outputs from the convolutional layer to reduce network size
- The parameters of the network can be learned through regular back propagation
 - Maxpooling layers must propagate derivatives only over the maximum element in each pool
 - Other pooling operators can use regular gradients or subgradients
 - Derivatives must sum over appropriate sets of elements to account for the fact that the network is, in fact, a shared parameter network

An implicit assumption

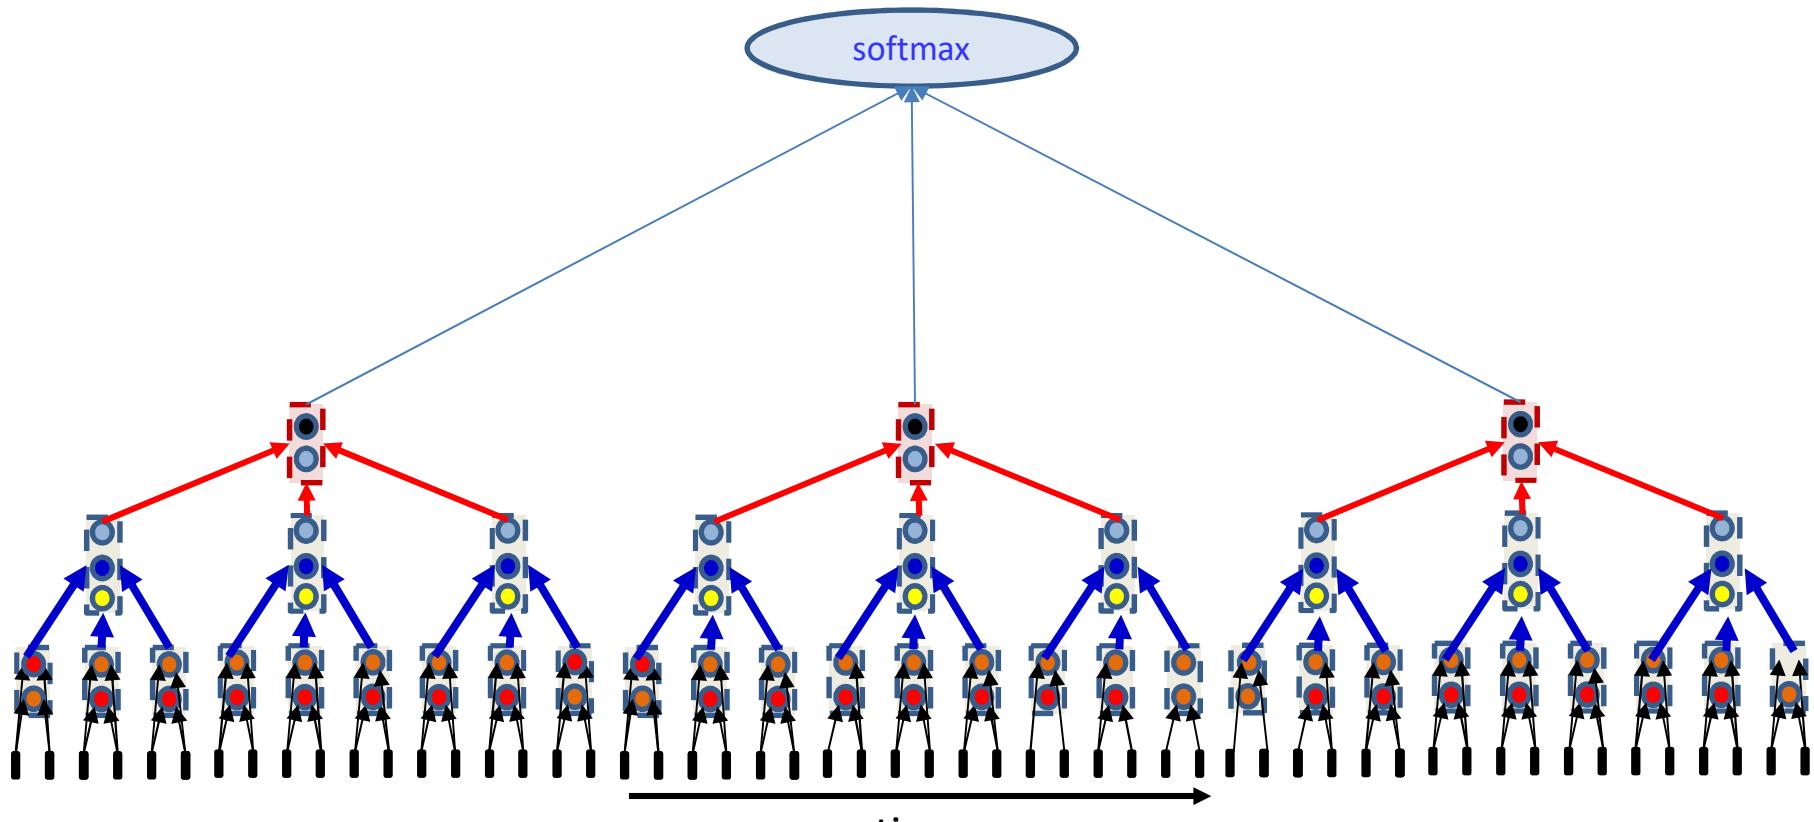

- We've always assumed that subsequent steps *shrink* the size of the maps
- Can subsequent maps *increase* in size

Recall this 1-D figure

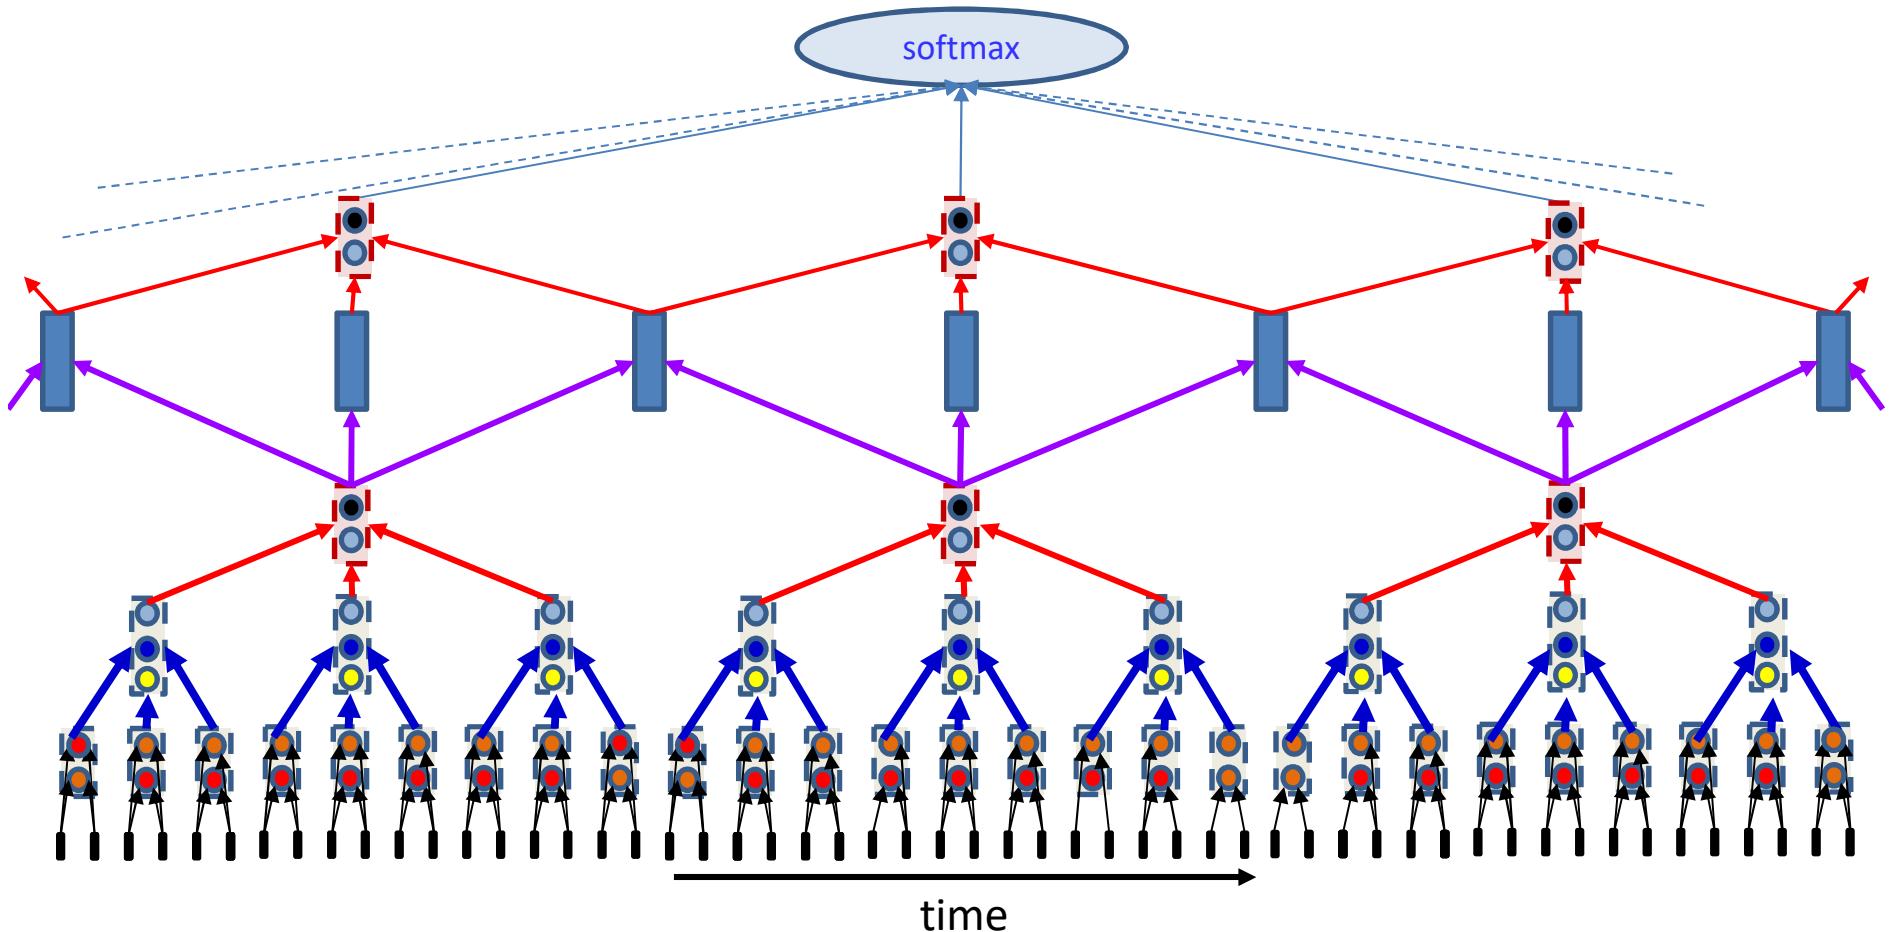

- We've seen this before.. where??

Recall this 1-D figure

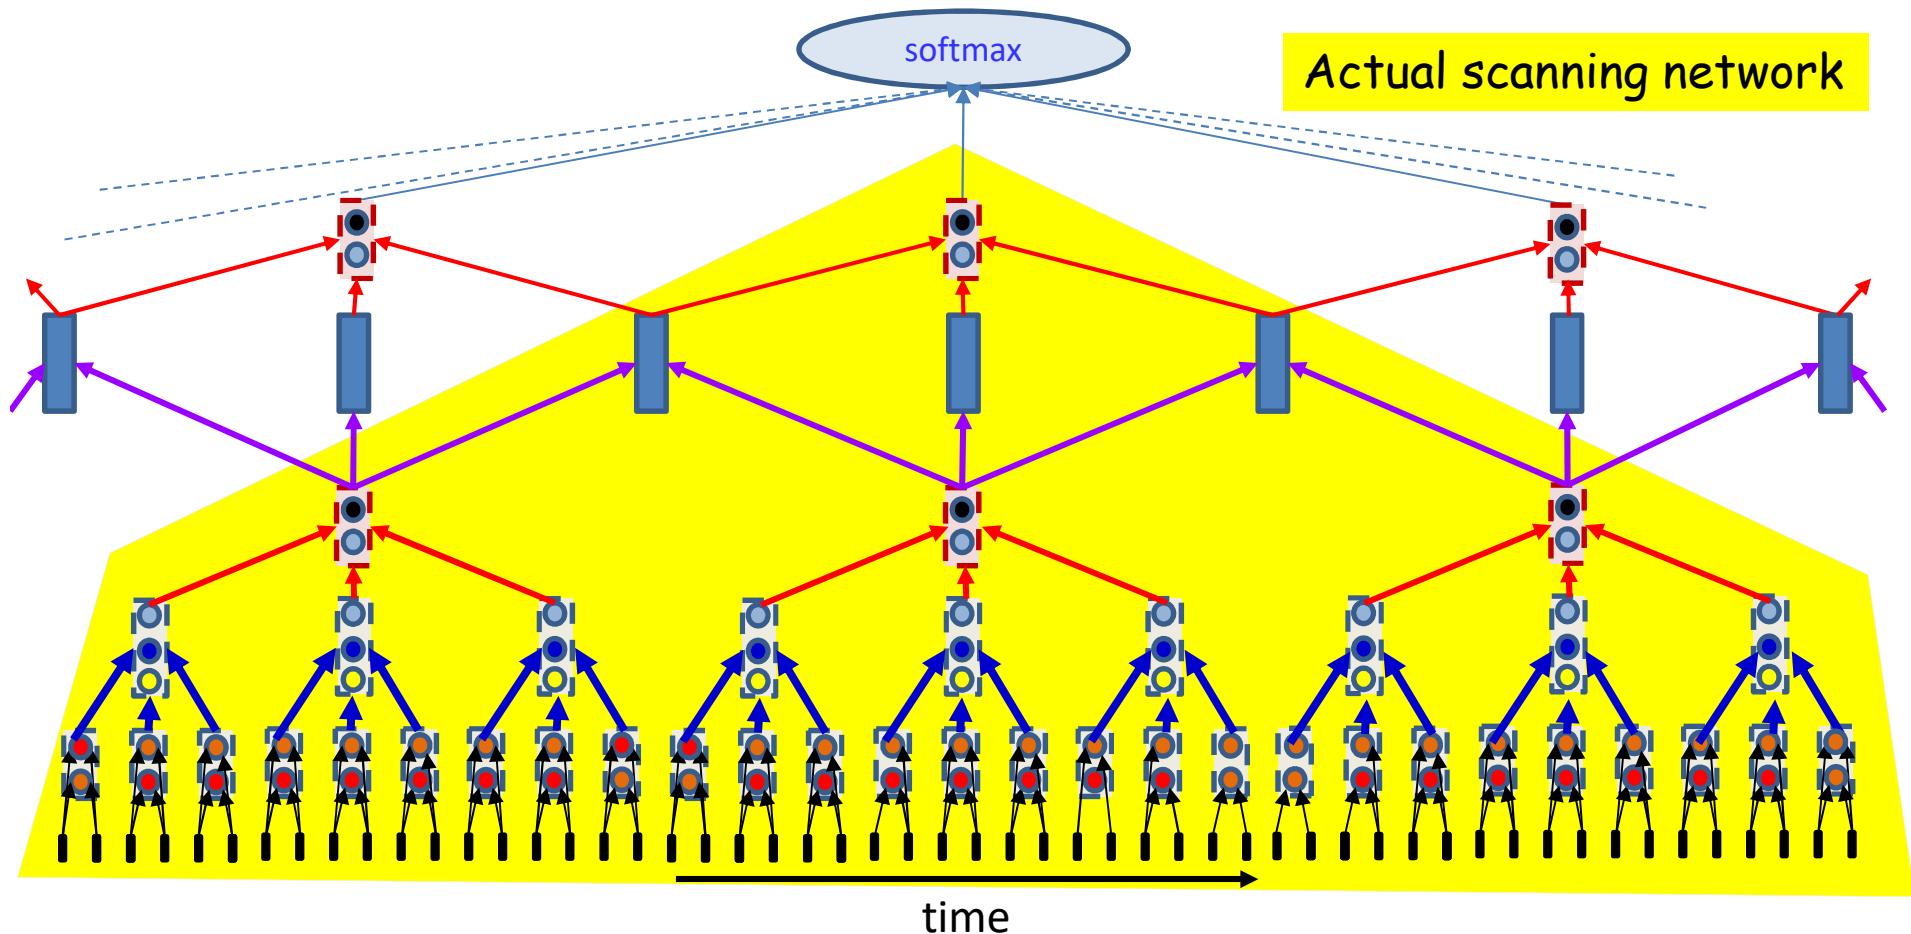

- Simplified diagram

With layer of increased resolution

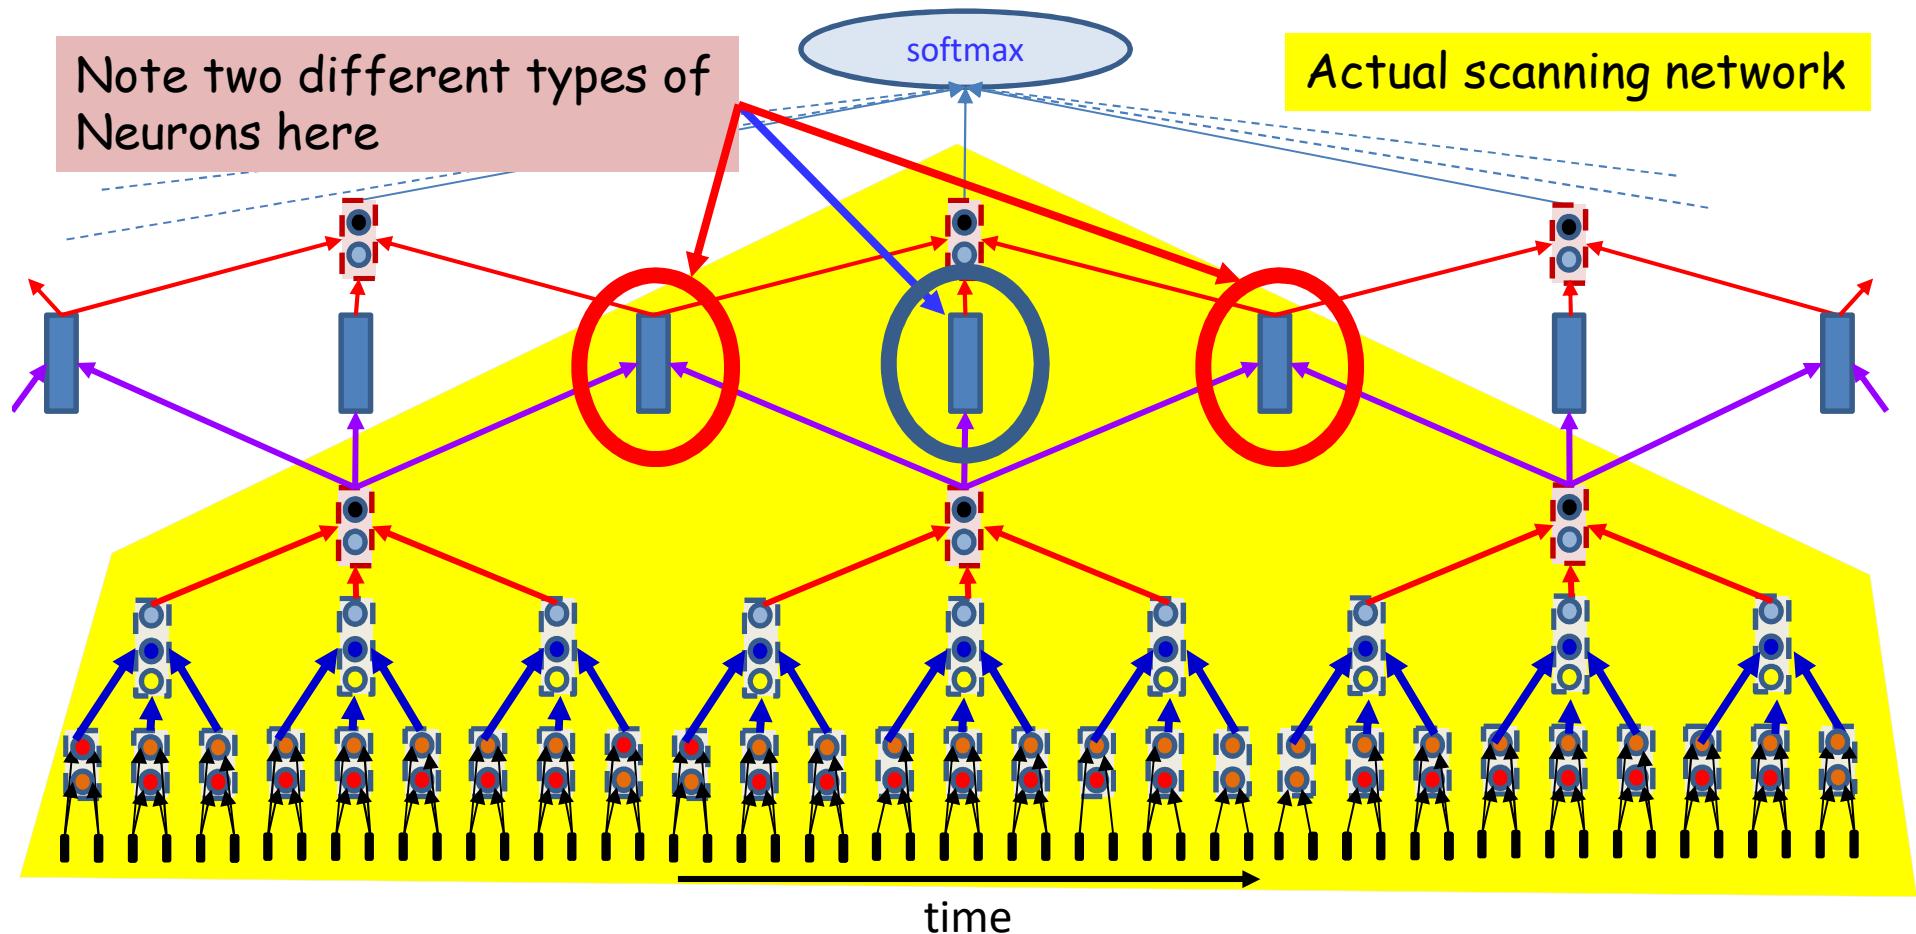

- *Maintaining Symmetry:*
 - Vertical bars in the 4th layer are regularly arranged w.r.t. bars of layer 3
 - The pattern of values of upward weights for each of the three pink (3rd layer) bars is identical

With layer of increased resolution

 - Vertical bars in the 4th layer are regularly arranged w.r.t. bars of layer 3
 - The pattern of values of upward weights for each of the three pink (3rd layer) bars is identical

Scanning with increased-res layer

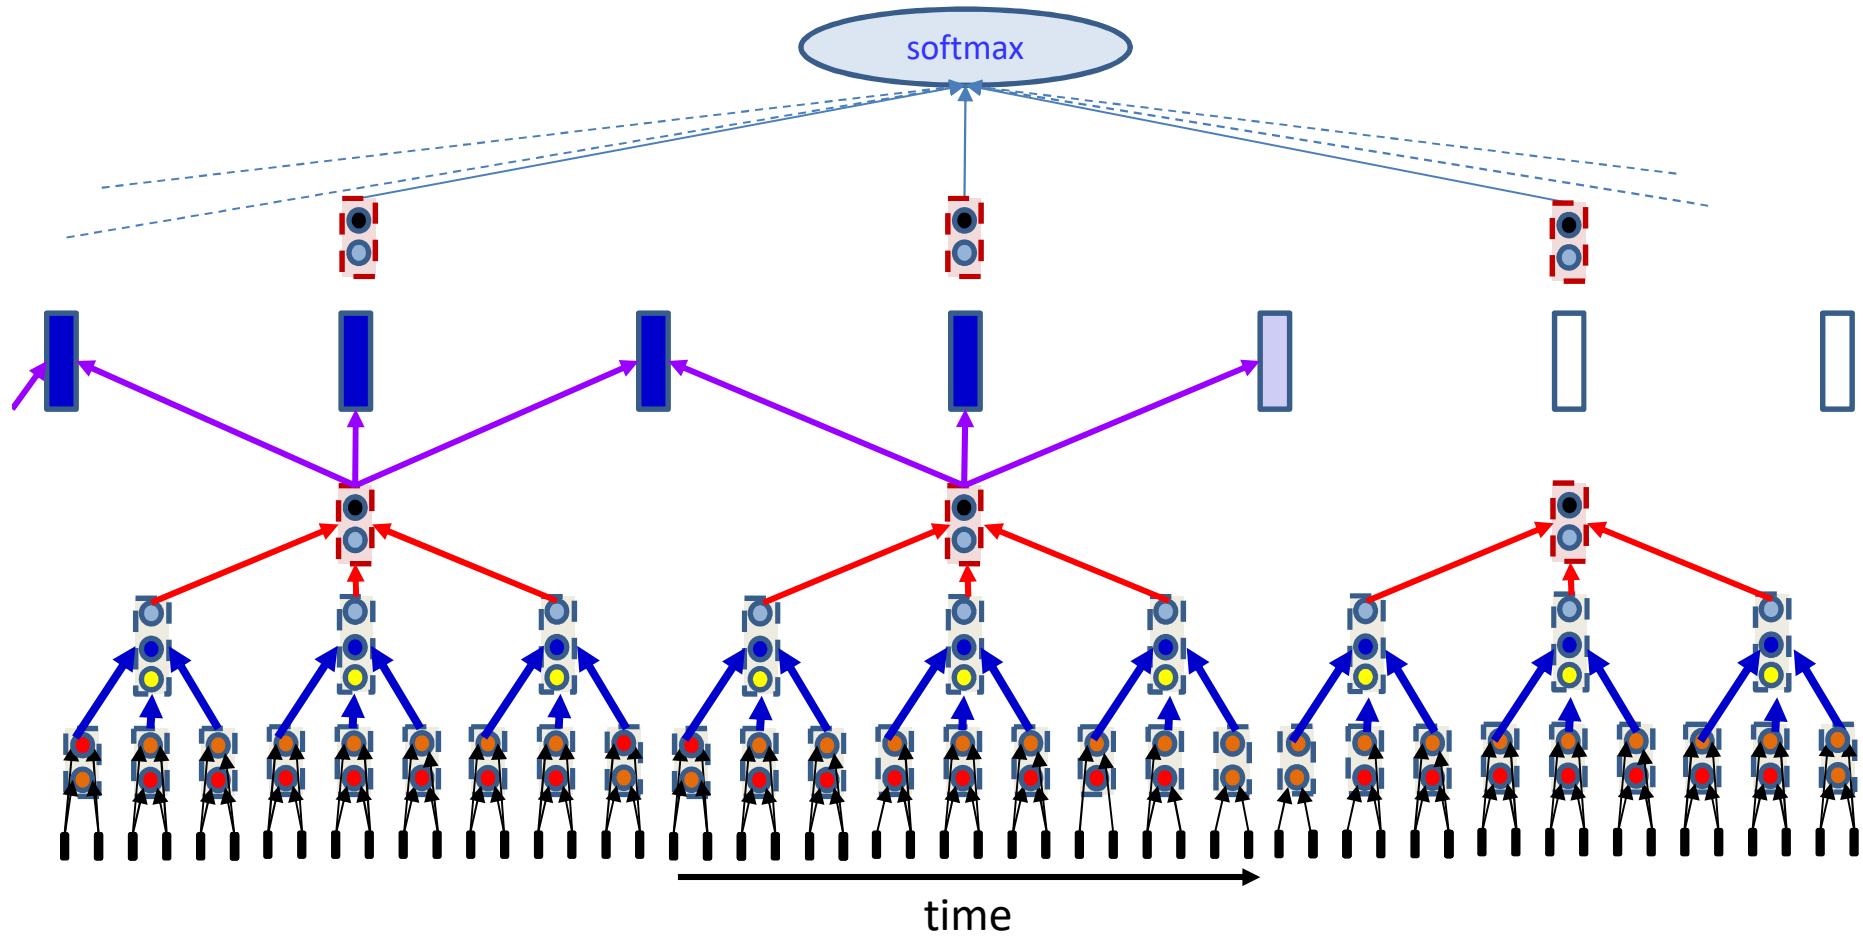

- Flow of info from bottom to top when implemented as a left-to-right scan
 - Note: Arrangement of vertical bars is predetermined by architecture¹⁷⁸

With layer of increased size

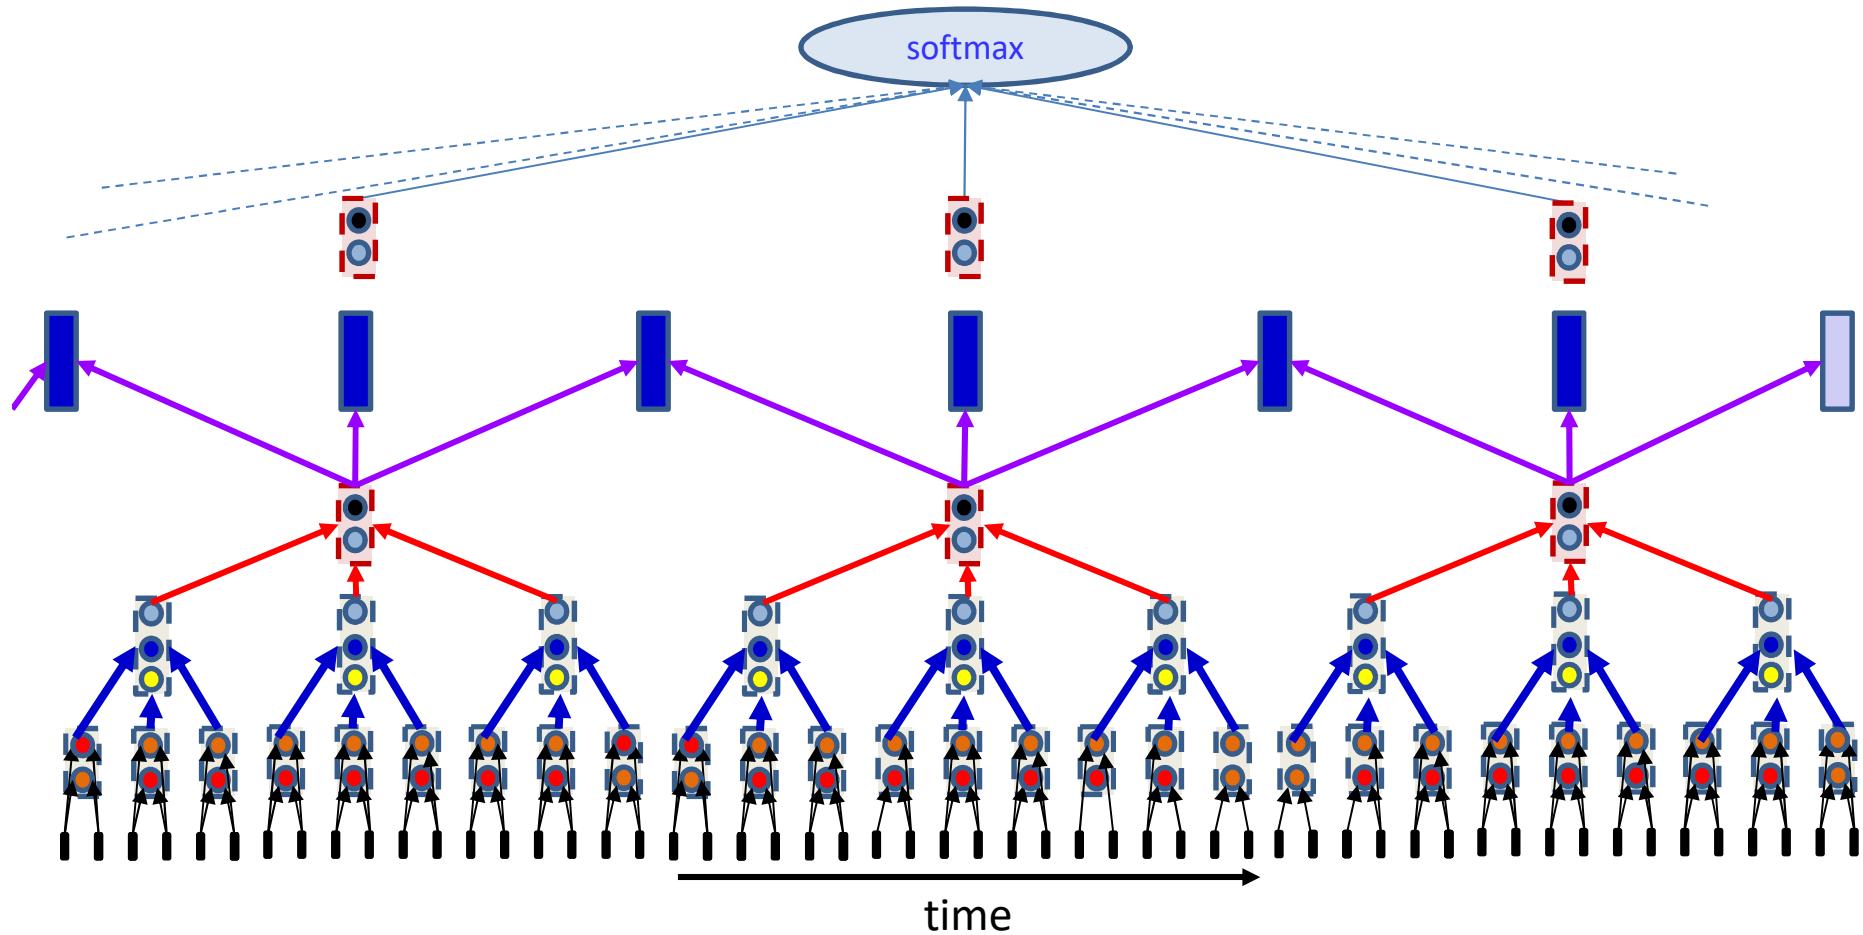

- Flow of info from bottom to top when implemented as a left-to-right scan
 - Note: Arrangement of vertical bars is predetermined by architecture¹⁷⁹

With layer of increased size

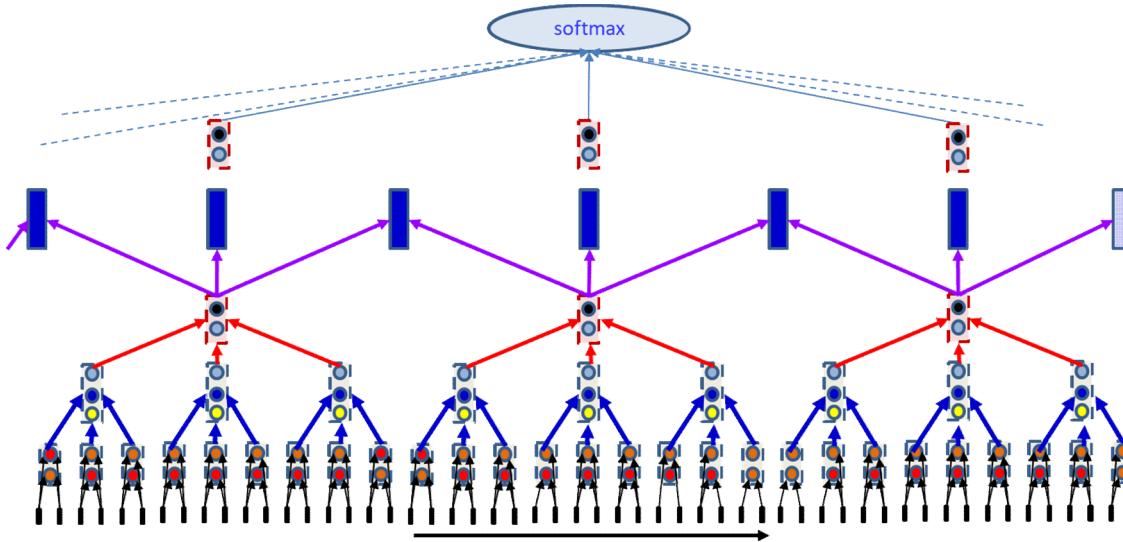

- Flow of info from bottom to top when implemented as a left-to-right scan
 - Note: Arrangement of vertical bars is predetermined by architecture¹⁸⁰

With layer of increased size

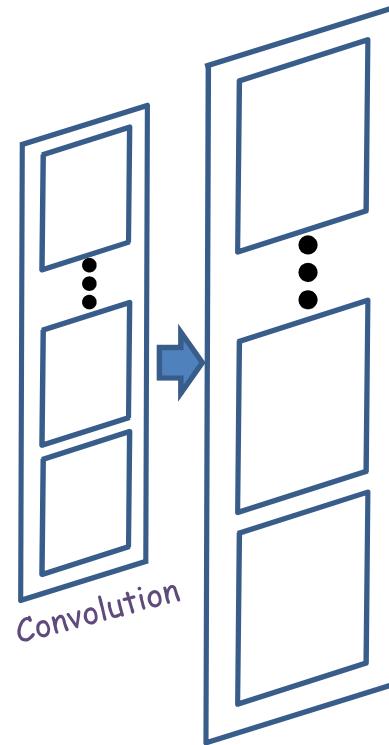

- Flow of info from bottom to top when implemented as a left-to-right scan
 - Note: Arrangement of vertical bars is predetermined by architecture¹⁸¹

“Transposed Convolution”

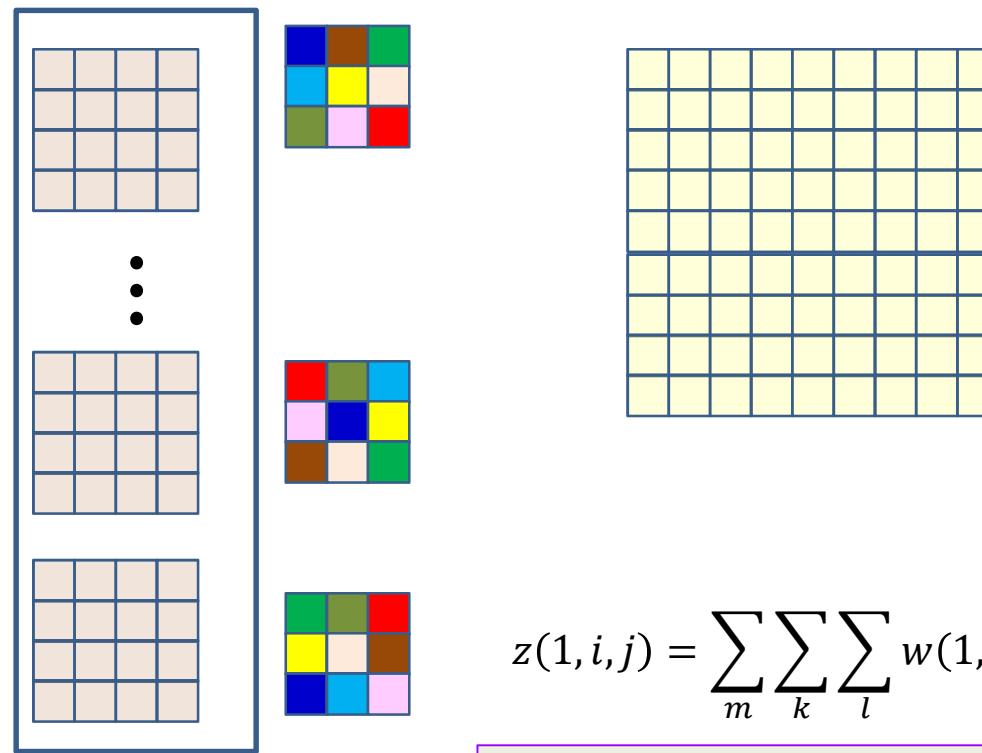

- Connection rules are transposed for expanding layers
 - In shrinking layers, the pattern of *incoming weights* is identical for each bar
 - In expanding layers, the pattern of *outgoing (upward) weights* is identical for each bar
- When thought of as an MLP, can write
$$Z_l = W_l Y_{l-1}$$
- W_l is broader than tall for a shrinking layer
- W_l is taller than broad for an expanding layer
 - Sometimes viewed as the transpose of a broad matrix
- Leading to terminology “transpose convolution”

In 2-D

- Similar computation

2D expanding convolution

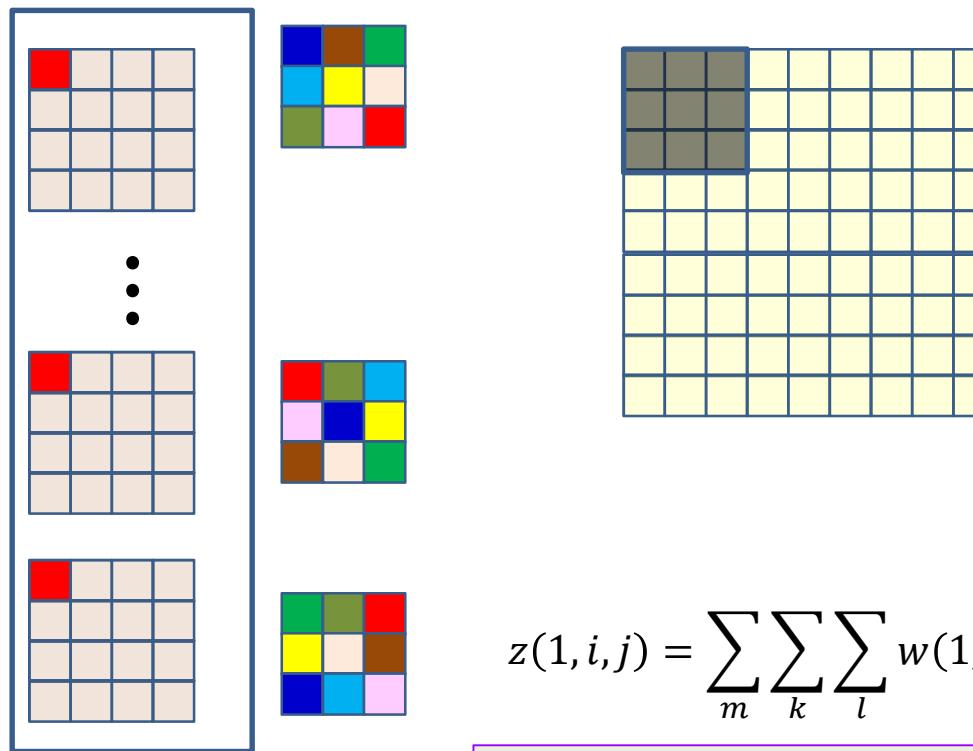

$$z(1, i, j) = \sum_m \sum_k \sum_l w(1, m, i - kb, j - lb) I(m, k, l)$$

b is the “stride”
(scaling factor between the sizes of Z and Y)

- Output size is typically an integer multiple of input
 - +1 if filter width is odd
 - Easier to determine assignment of output to input

2D expanding convolution

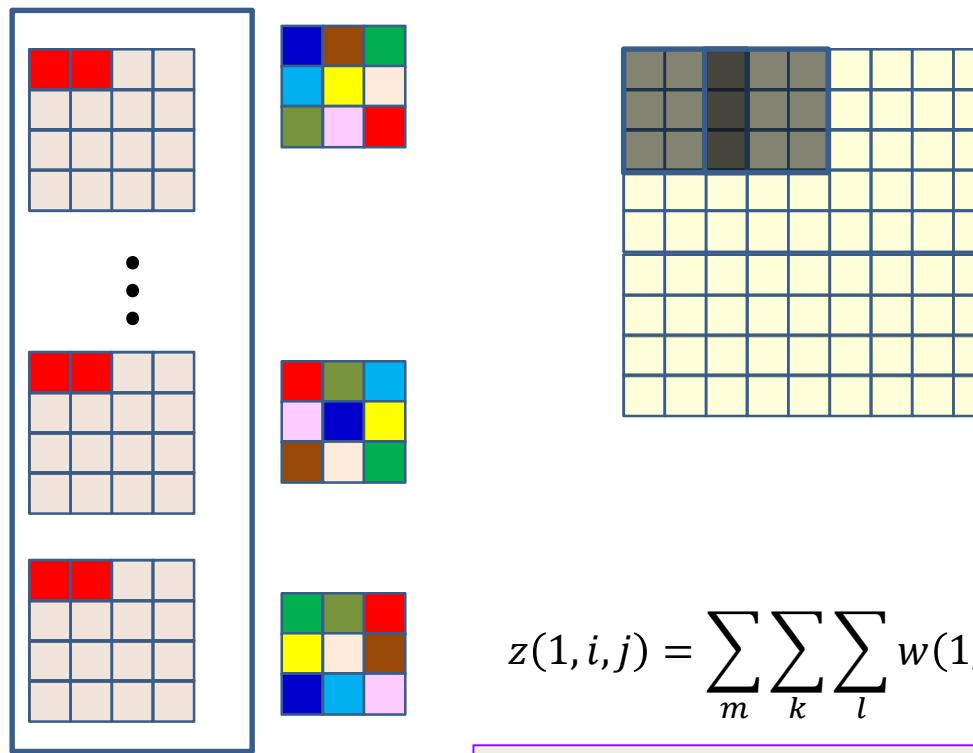

$$z(1, i, j) = \sum_m \sum_k \sum_l w(1, m, i - kb, j - lb) I(m, k, l)$$

(scaling factor between the sizes of Z and Y)

- Output size is typically an integer multiple of input
 - +1 if filter width is odd
 - Easier to determine assignment of output to input

2D expanding convolution

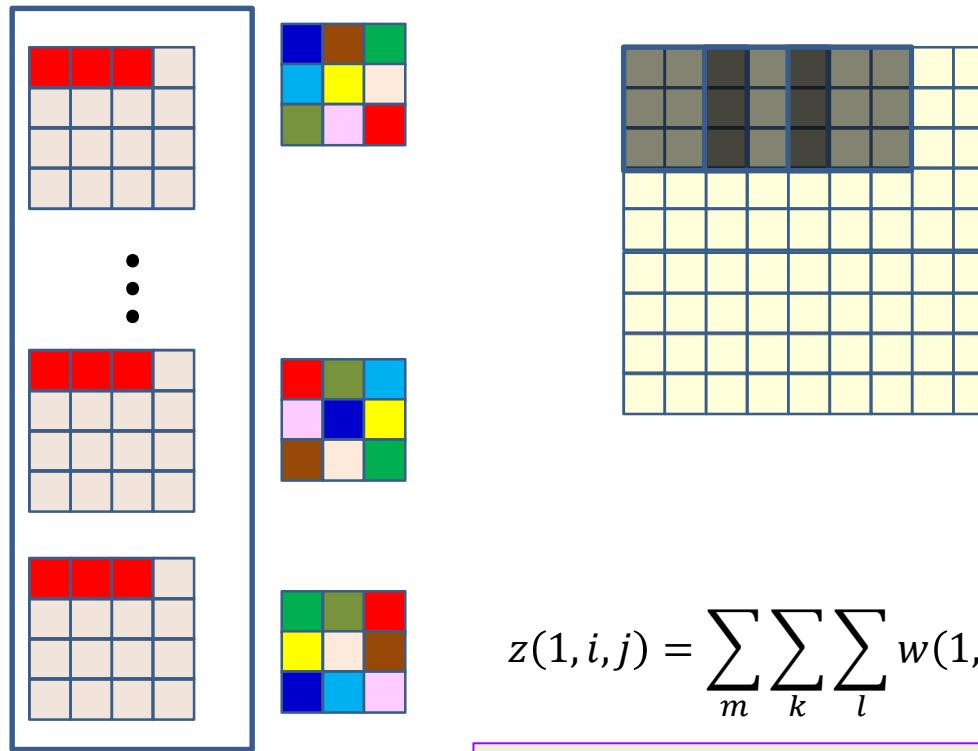

$$z(1, i, j) = \sum_m \sum_k \sum_l w(1, m, i - kb, j - lb) I(m, k, l)$$

b is the “stride”
(scaling factor between the sizes of Z and Y)

- Output size is typically an integer multiple of input
 - +1 if filter width is odd
 - Easier to determine assignment of output to input

2D expanding convolution

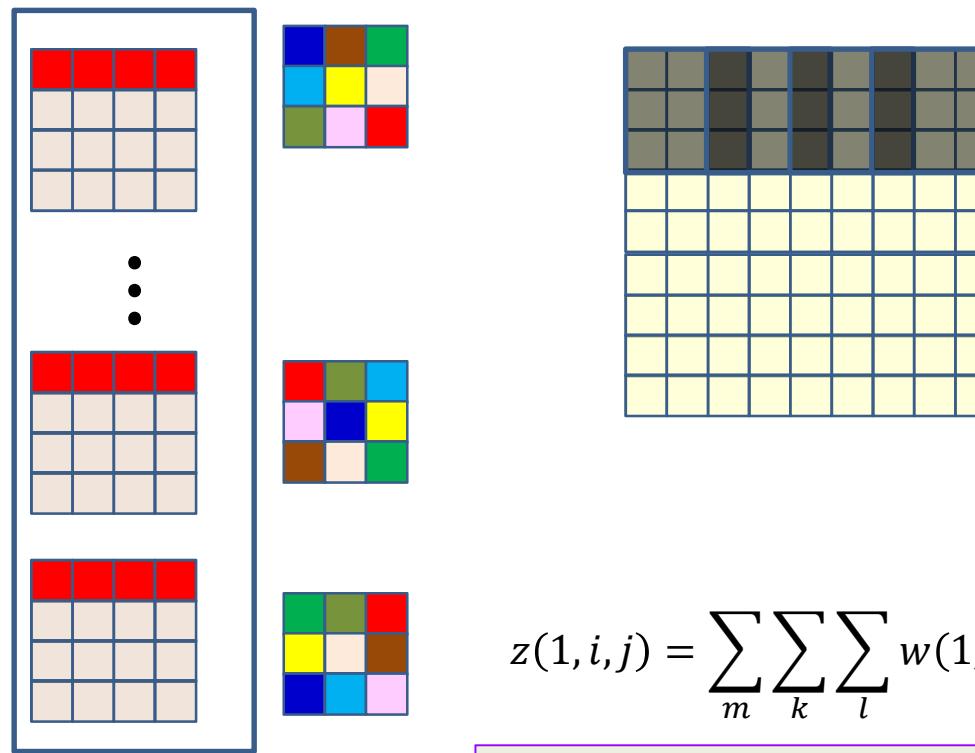

$$z(1, i, j) = \sum_m \sum_k \sum_l w(1, m, i - kb, j - lb) I(m, k, l)$$

b is the “stride”
(scaling factor between the sizes of Z and Y)

- Output size is typically an integer multiple of input
 - +1 if filter width is odd
 - Easier to determine assignment of output to input

2D expanding convolution

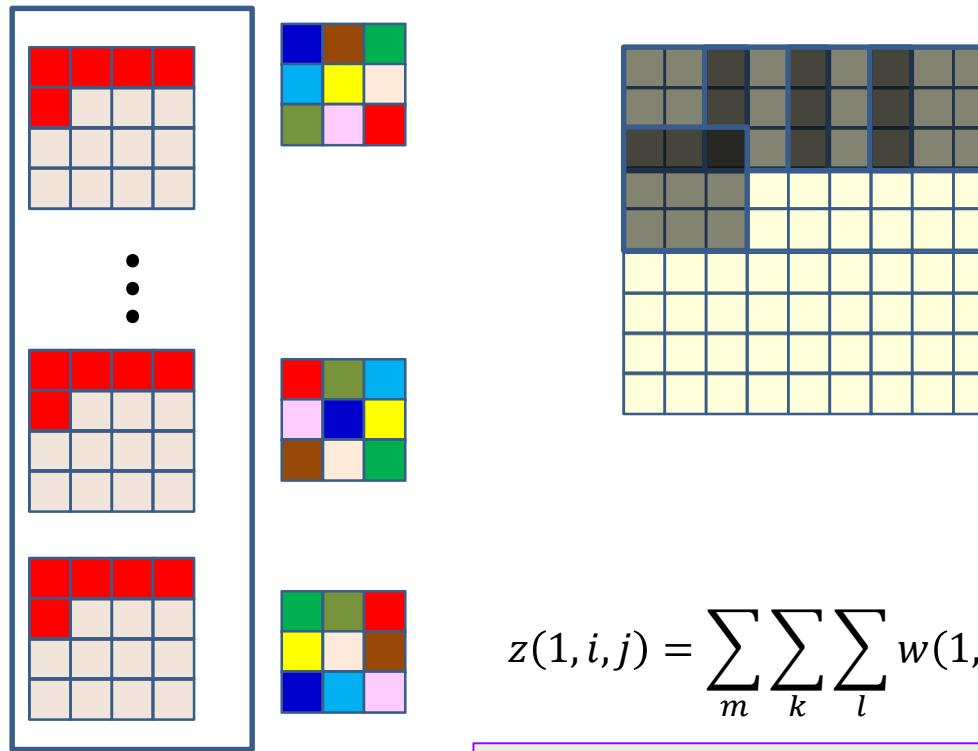

$$z(1, i, j) = \sum_m \sum_k \sum_l w(1, m, i - kb, j - lb) I(m, k, l)$$

b is the “stride”
(scaling factor between the sizes of Z and Y)

- Output size is typically an integer multiple of input
 - +1 if filter width is odd
 - Easier to determine assignment of output to input

2D expanding convolution

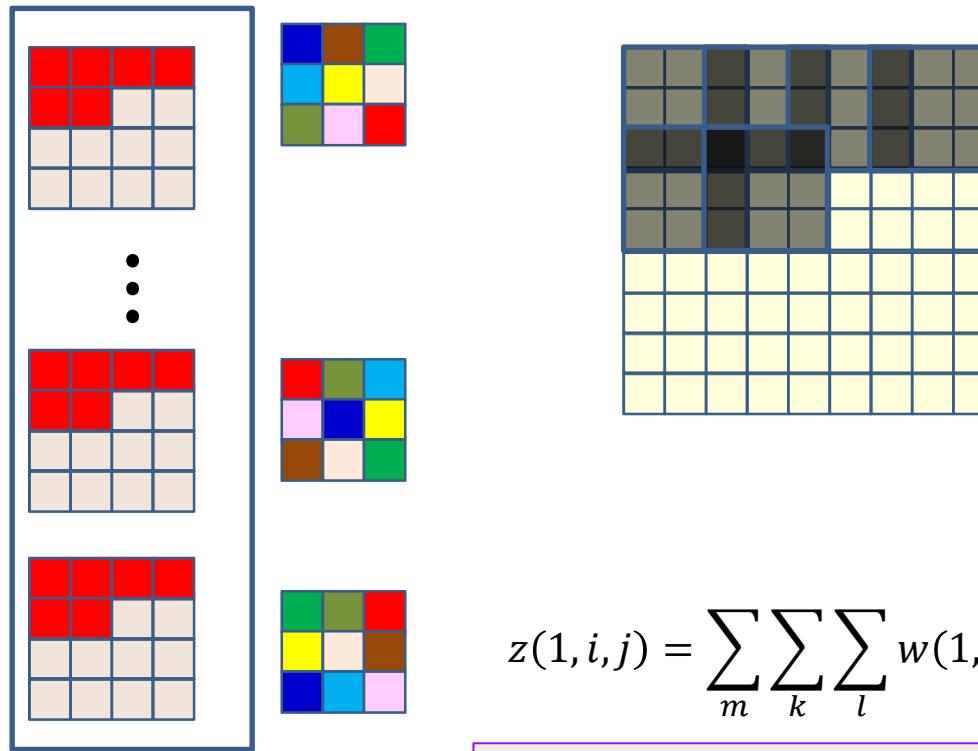

$$z(1, i, j) = \sum_m \sum_k \sum_l w(1, m, i - kb, j - lb) I(m, k, l)$$

b is the “stride”
(scaling factor between the sizes of Z and Y)

- Output size is typically an integer multiple of input
 - +1 if filter width is odd
 - Easier to determine assignment of output to input

CNN: Expanding convolution layer l

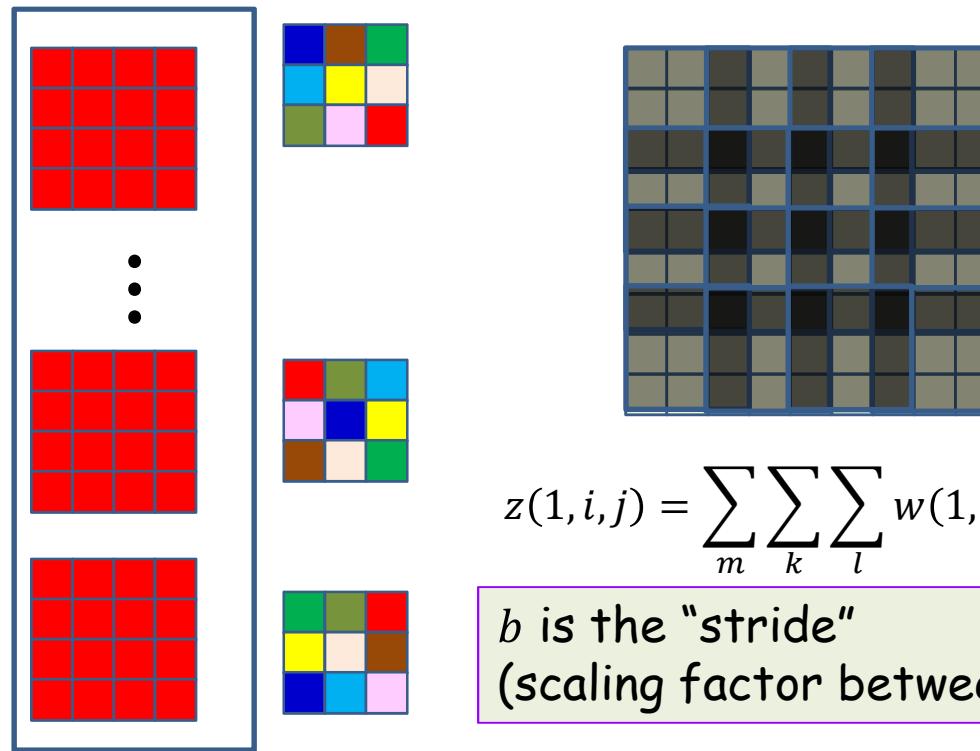

```
Z(l) = zeros(Dl x ((W-1)b+Kl) x ((H-1)b+Kl)) # b = stride
for j = 1:Dl
    for x = 1:W
        for y = 1:H
            for i = 1:Dl-1
                for x' = 1:Kl
                    for y' = 1:Kl
                        z(l,j,(x-1)b+x', (y-1)b+y') +=
                            w(l,j,i,x',y') y(l-1,i,x,y)
```

CNN: Expanding convolution layer l

```
Z(l) = zeros(Dl x ((W-1)b+Kl) x ((H-1)b+Kl)) # b = stride
for j = 1:Dl
    for x = 1:W
        for y = 1:H
            for i = 1:Dl-1
                for x' = 1:Kl
                    for y' = 1:Kl
                        z(l,j,(x-1)b+x', (y-1)b+y') +=
                            w(l,j,i,x',y') y(l-1,i,x,y)
```

We leave the rather trivial issue of how to modify this code to compute the derivatives w.r.t w and y to you

2D expanding convolution

- Also called *transpose convolution*
 - If you recast the CNN as a shared-parameter MLP, expanding layers have weight matrices that are taller than wide
- Also called “deconvolution”
 - Strictly speaking, abuse of terminology

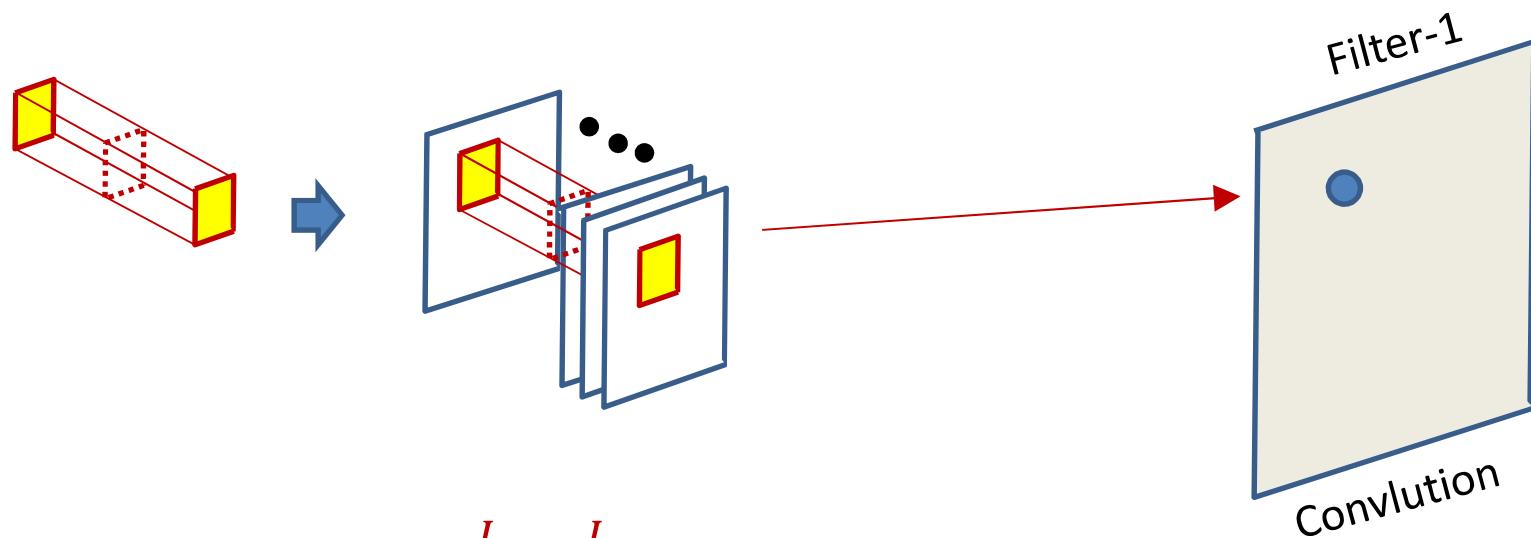

Invariance

- CNNs are shift invariant
- What about rotation, scale or reflection invariance

Shift-invariance – a different perspective

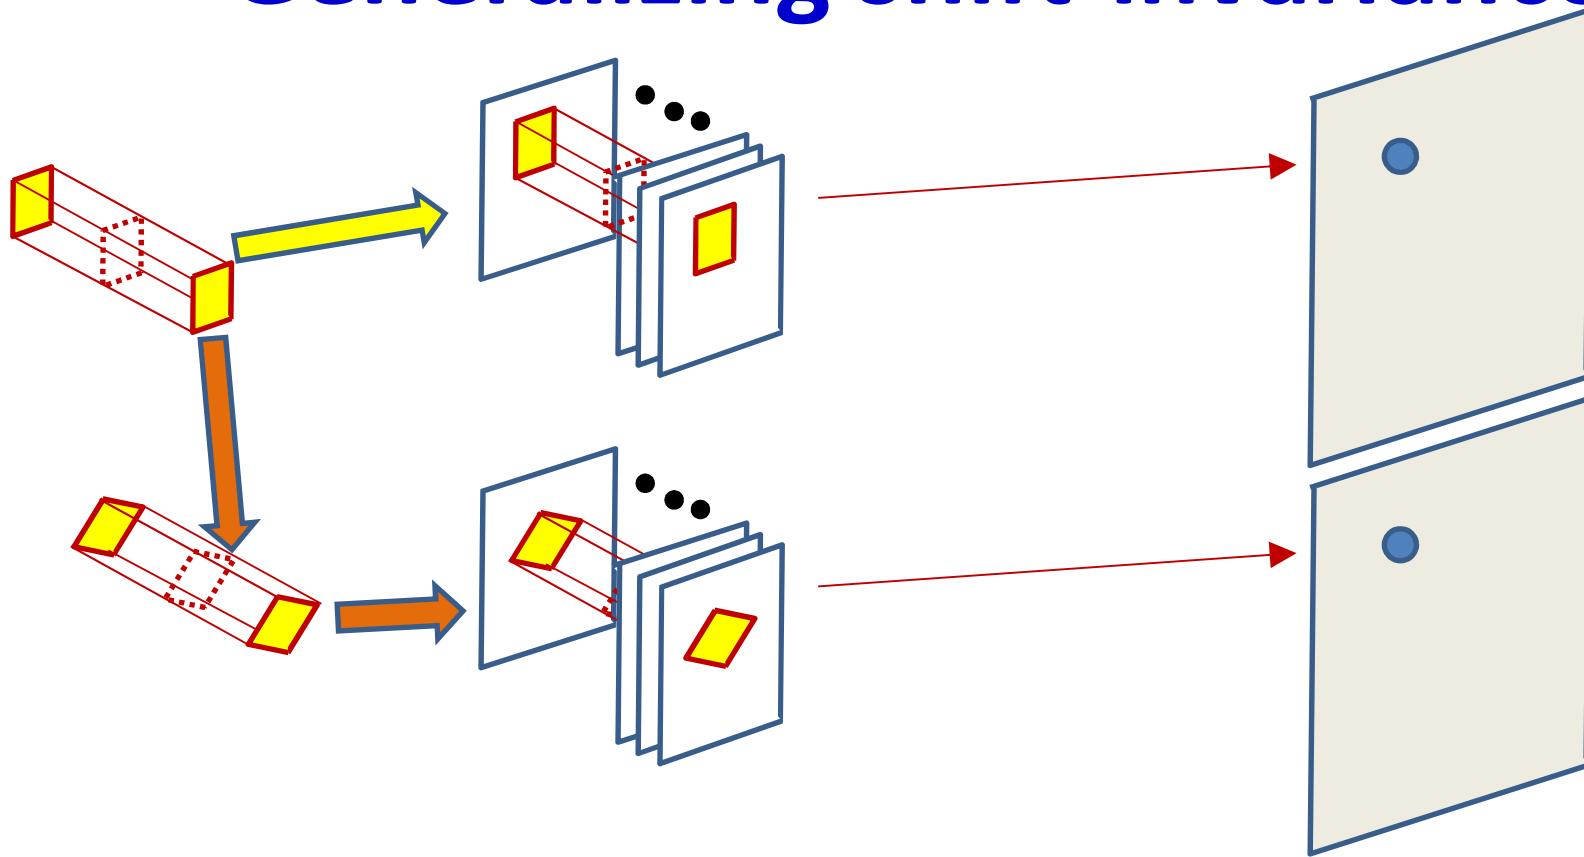

$$z(l, s, i, j) = \sum_p \sum_{k=1}^L \sum_{m=1}^L w(l, s, p, k, m) Y(l - 1, p, i + k, j + m)$$

- We can rewrite this as so (tensor inner product)

$$z(s, i, j) = \mathbf{Y}.shift(\mathbf{w}(s), i, j)$$

Generalizing shift-invariance

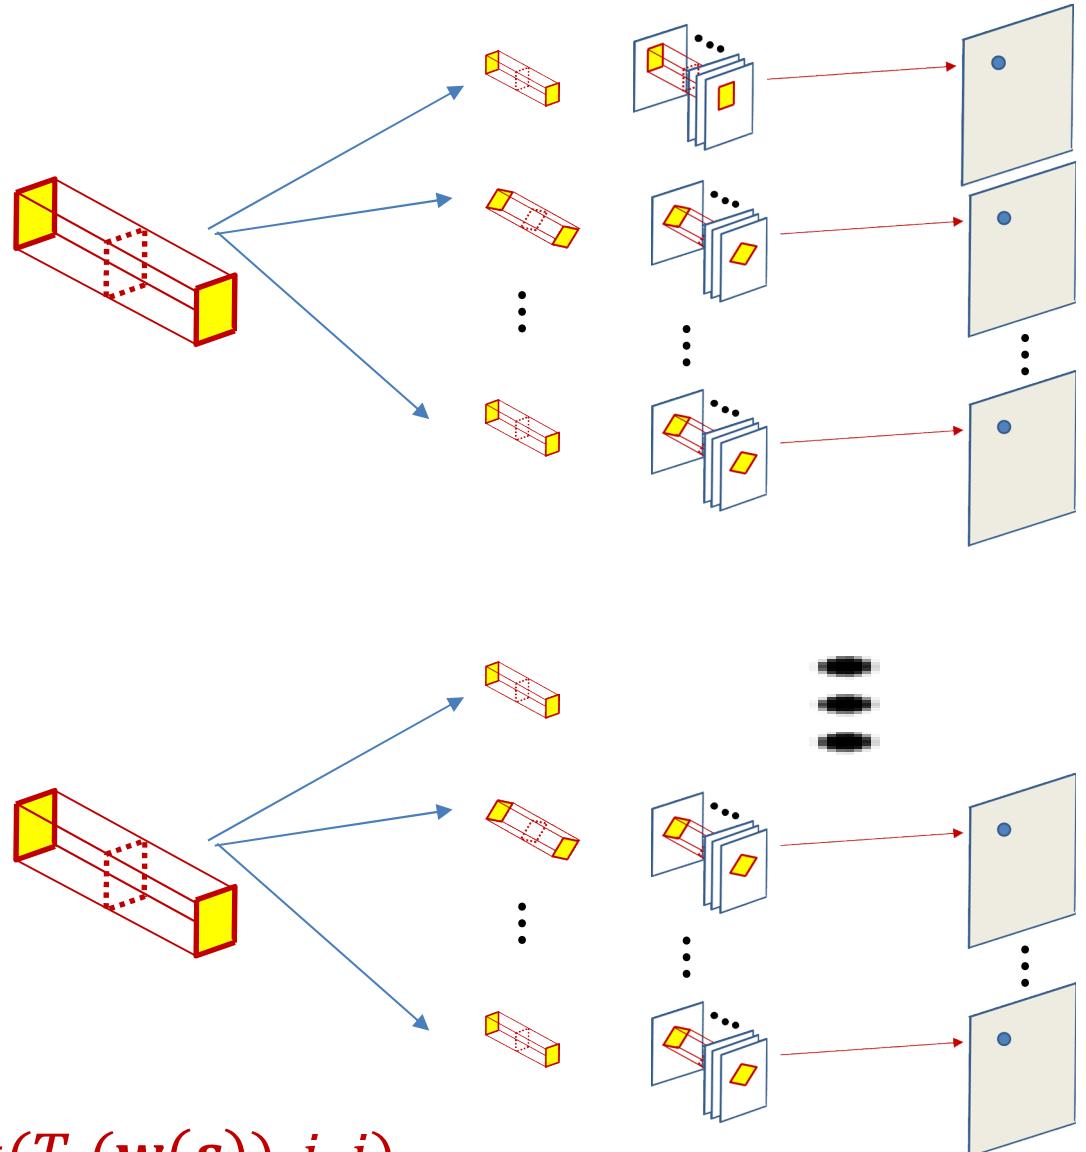

$$z_{regular}(s, i, j) = Y.\text{shift}(\mathbf{w}(s), i, j)$$

- Also find *rotated by 45 degrees* version of the pattern

$$z_{rot45}(s, i, j) = Y.\text{shift}(\text{rotate45}(\mathbf{w}(s)), i, j)$$

Transform invariance

- More generally each filter produces a set of transformed (and shifted) maps
 - Set of transforms must be enumerated and discrete
 - E.g. discrete set of rotations and scaling, reflections etc.
- The network becomes invariant to all the transforms considered

$$z_{T_t}(s, i, j) = Y.\text{shift}(T_t(\mathbf{w}(s)), i, j)$$

Regular CNN : single layer l

The weight $W(l, j)$ is a 3D $D_{l-1} \times K_1 \times K_1$ tensor

```
for j = 1:Dl
    for x = 1:Wl-1-Kl+1
        for y = 1:Hl-1-Kl+1
            segment = Y(l-1, :, x:x+Kl-1, y:y+Kl-1) #3D tensor
            z(l, j, x, y) = W(l, j).segment #tensor inner prod.
            Y(l, j, x, y) = activation(z(l, j, x, y))
```

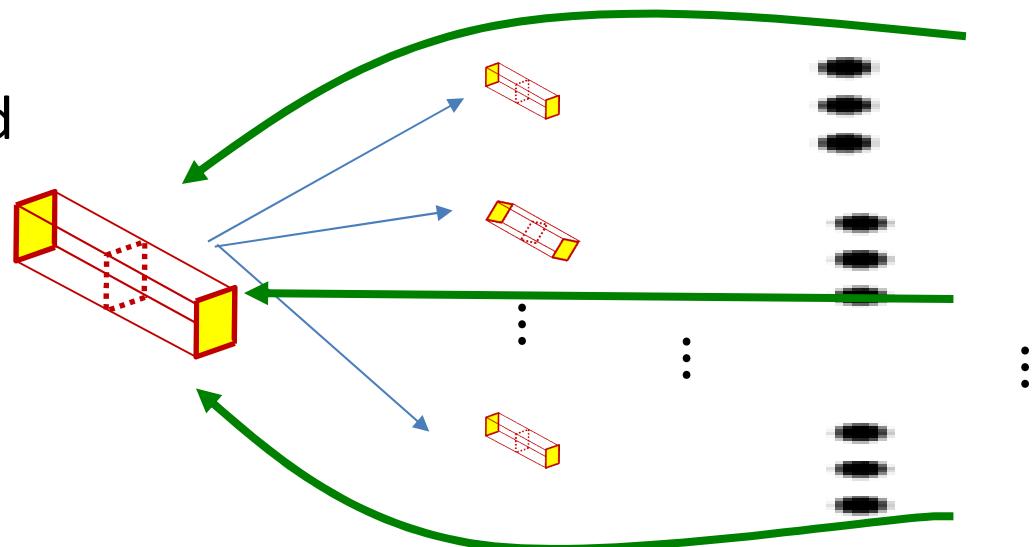

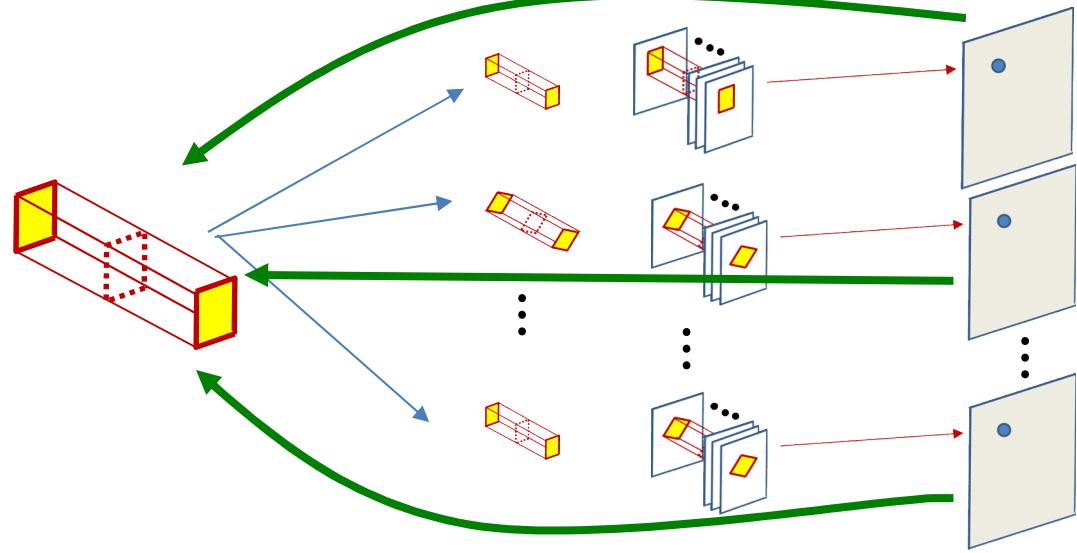

Transform invariance

The weight $W(l, j)$ is a 3D $D_{l-1} \times K_1 \times K_1$ tensor

```
m = 1
for j = 1:Dl
    for t in {Transforms} # enumerated transforms
        TW = T(W(l, j))
        for x = 1:Wl-1-Kl+1
            for y = 1:Hl-1-Kl+1
                segment = Y(l-1, :, x:x+Kl-1, y:y+Kl-1) #3D tensor
                z(l,m,x,y) = TW.segment #tensor inner prod.
                Y(l,m,x,y) = activation(z(l,m,x,y))
        m = m + 1
```

BP with transform invariance

- Derivatives flow back through the transforms to update individual filters
 - Need point correspondences between original and transformed filters
 - Left as an exercise

Story so far

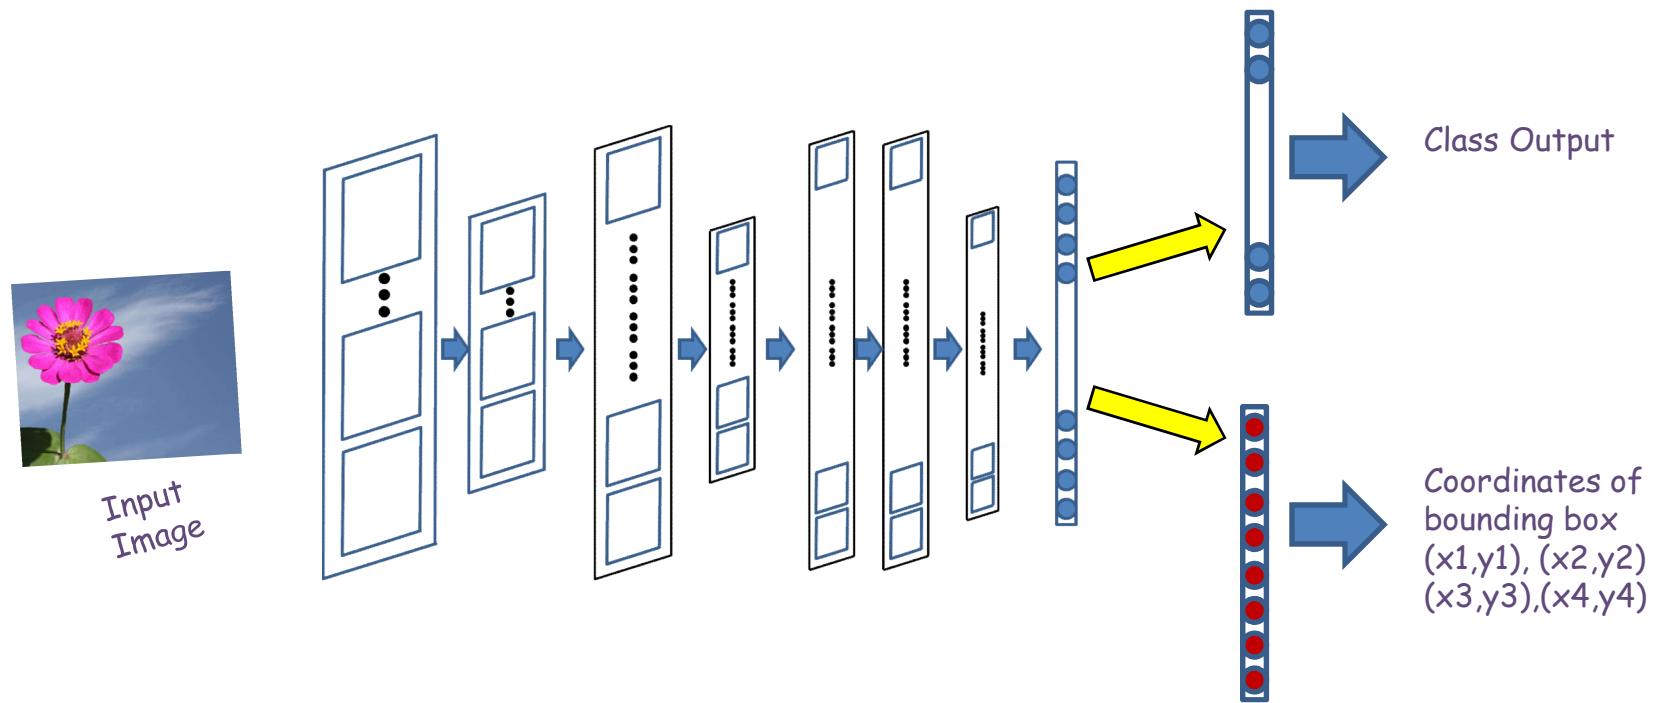

- CNNs are shift-invariant neural-network models for shift-invariant pattern detection
 - Are equivalent to scanning with shared-parameter MLPs with distributed representations
- The parameters of the network can be learned through regular back propagation
- Like a regular MLP, individual layers may either increase or decrease the span of the representation learned
- The models can be easily modified to include invariance to other transforms
 - Although these tend to be computationally painful

But what about the exact location?

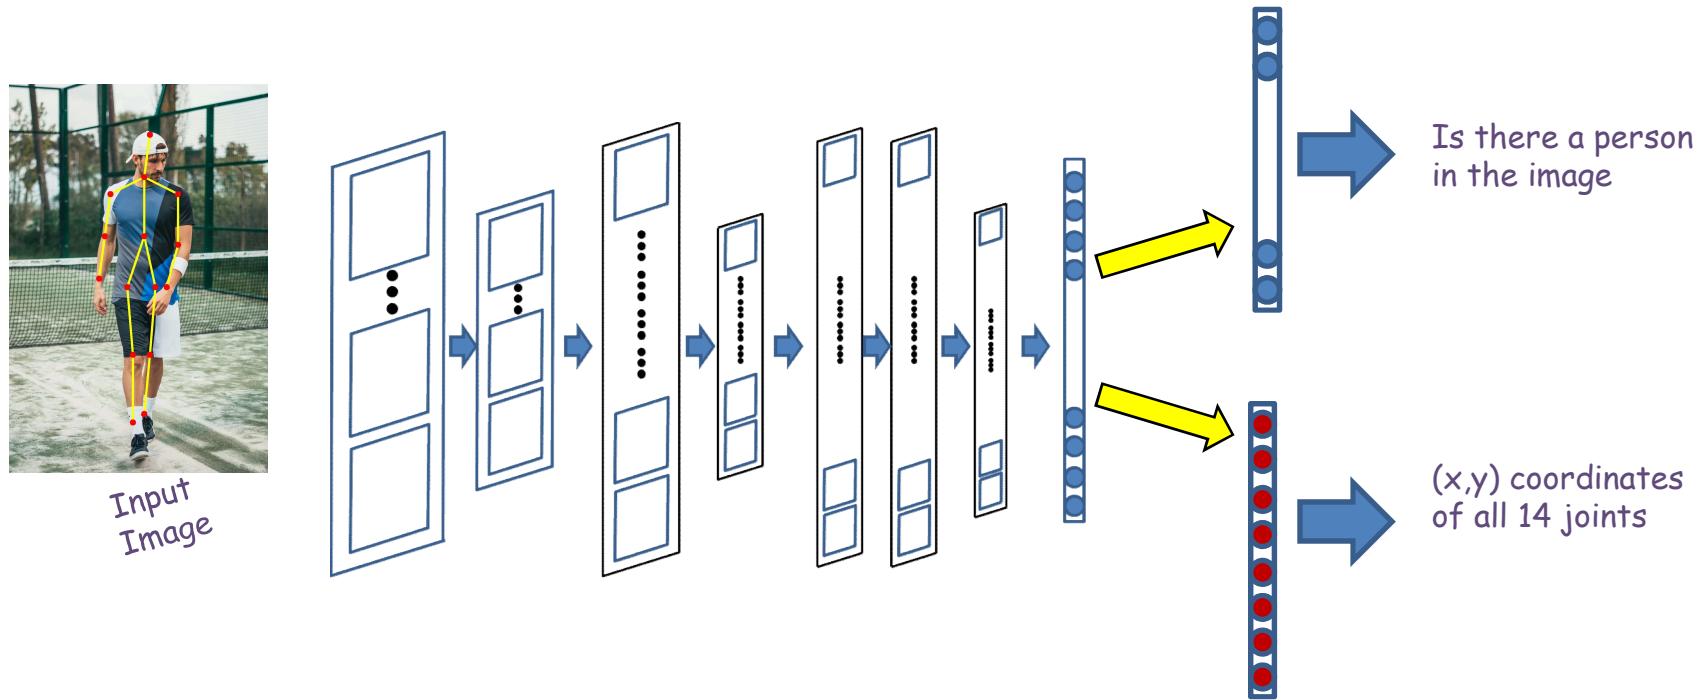

- We began with the desire to identify the picture as containing a flower, regardless of the position of the flower
 - Or more generally the class of object in the picture
- But can we detect the *position* of the main object?

Finding Bounding Boxes

- The flatten layer outputs to two separate output layers
- One predicts the class of the output
- The second predicts the corners of the bounding box of the object (8 coordinates) in all
- The divergence minimized is the sum of the cross-entropy loss of the classifier layer and L2 loss of the bounding-box predictor
 - Multi-task learning

Pose estimation

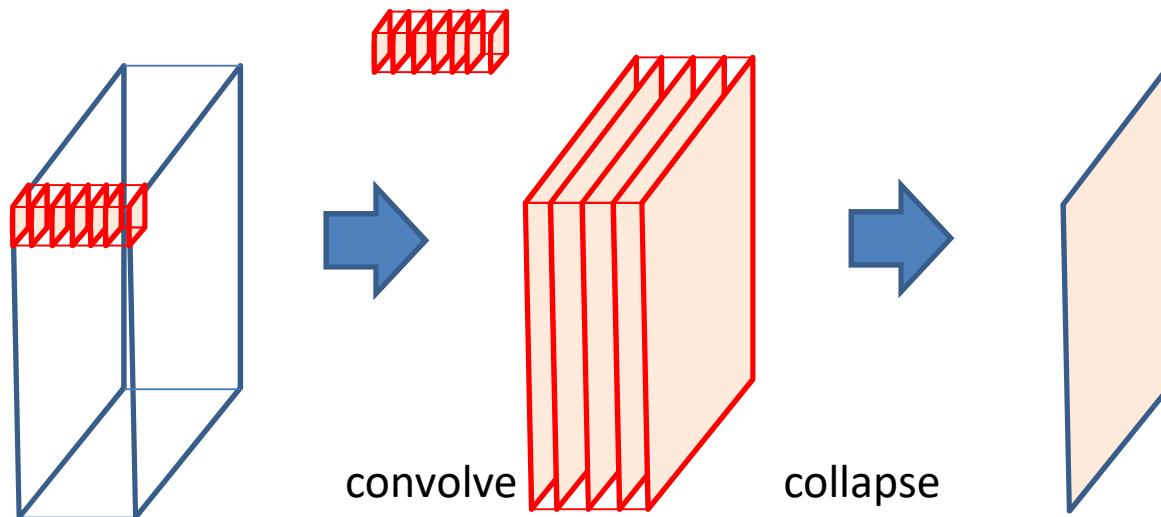

- Can use the same mechanism to predict the joints of a stick model
 - For post estimation

Model variations

- *Very deep networks*
 - 100 or more layers in MLP
 - Formalism called “Resnet”
- *“Depth-wise” convolutions*
 - Instead of multiple independent filters with independent parameters, use common layer-wise weights and combine the layers differently for each filter

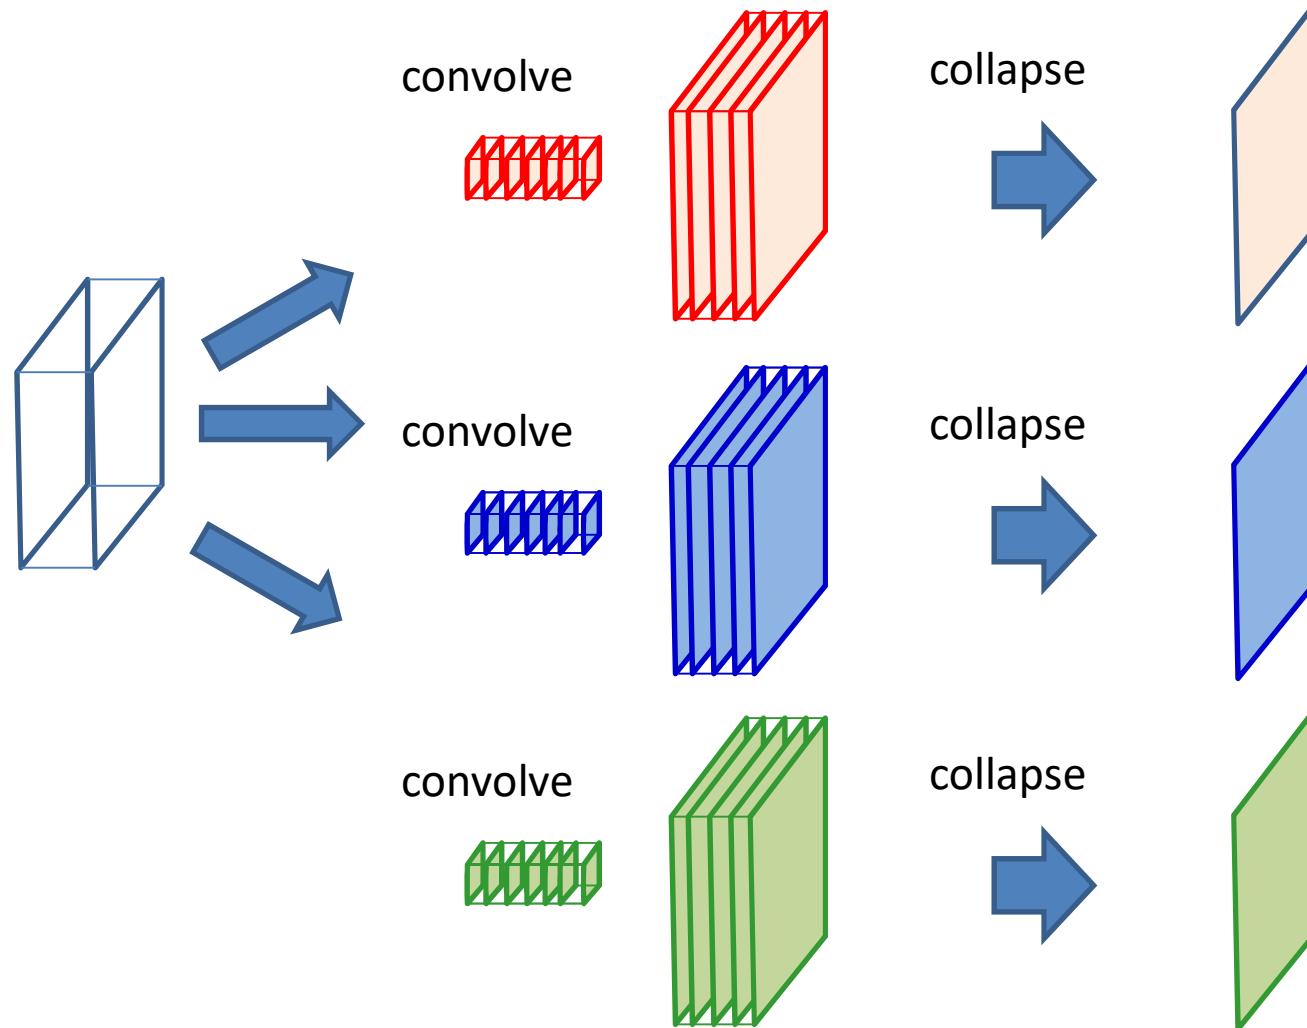

Depth-wise convolutions

Conventional

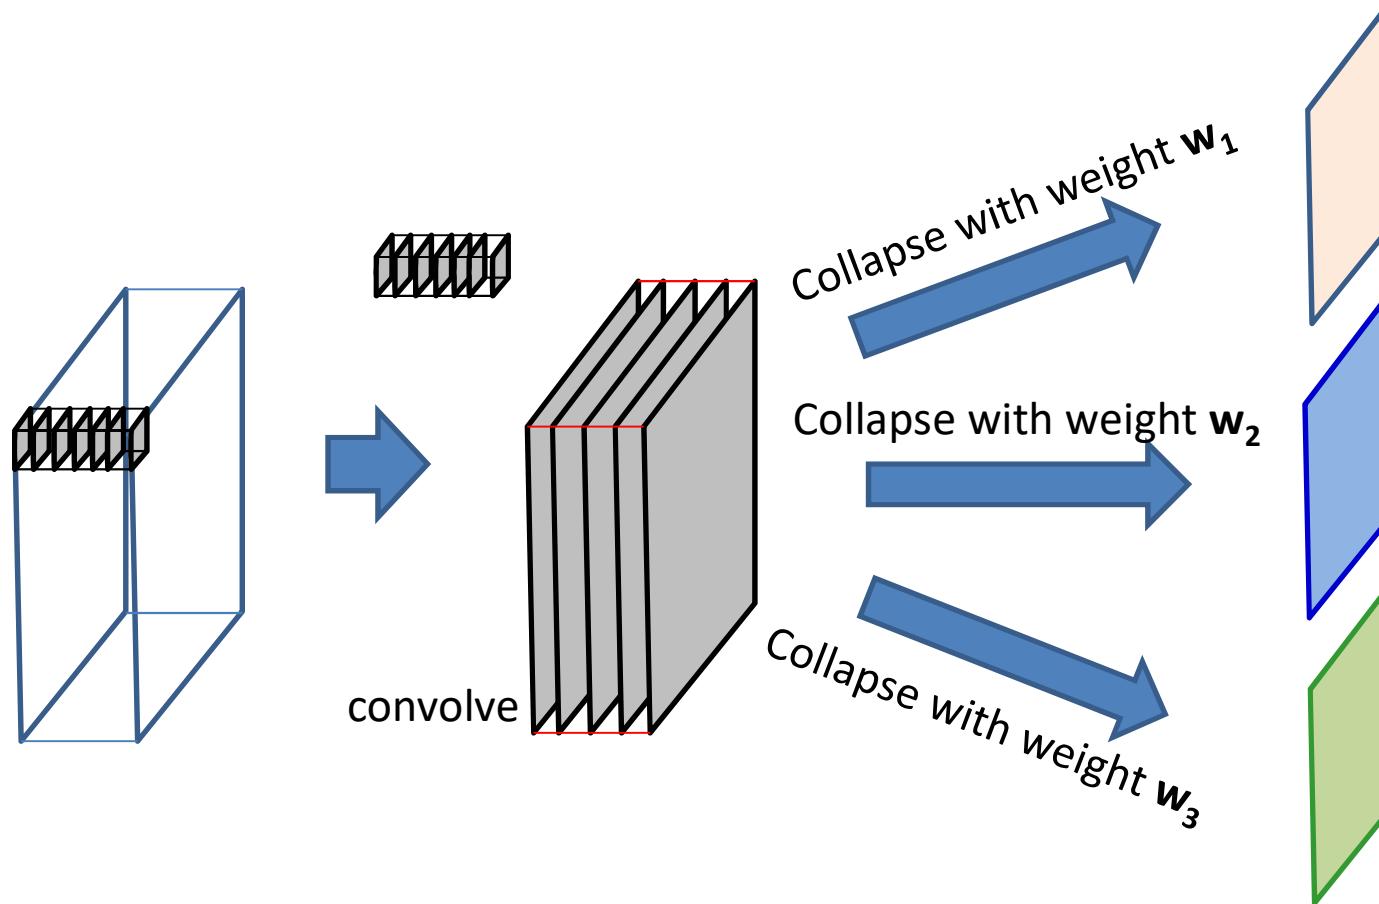

- Alternate view of conventional convolution:
- *Each layer of each filter* scans its corresponding map to produce a convolved map
- N input channels will require a filter with N layers
- The independent convolutions of each layer of the filter result in N convolved maps
- The N convolved maps are *added together* to produce the final output map (or channel) for that filter

Conventional convolutions

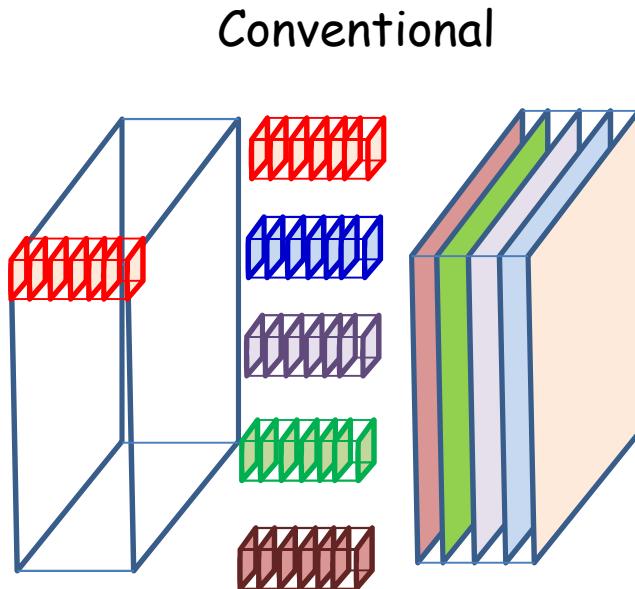

- This is done separately for each of the M filters producing M output maps (channels)

Depth-wise convolution

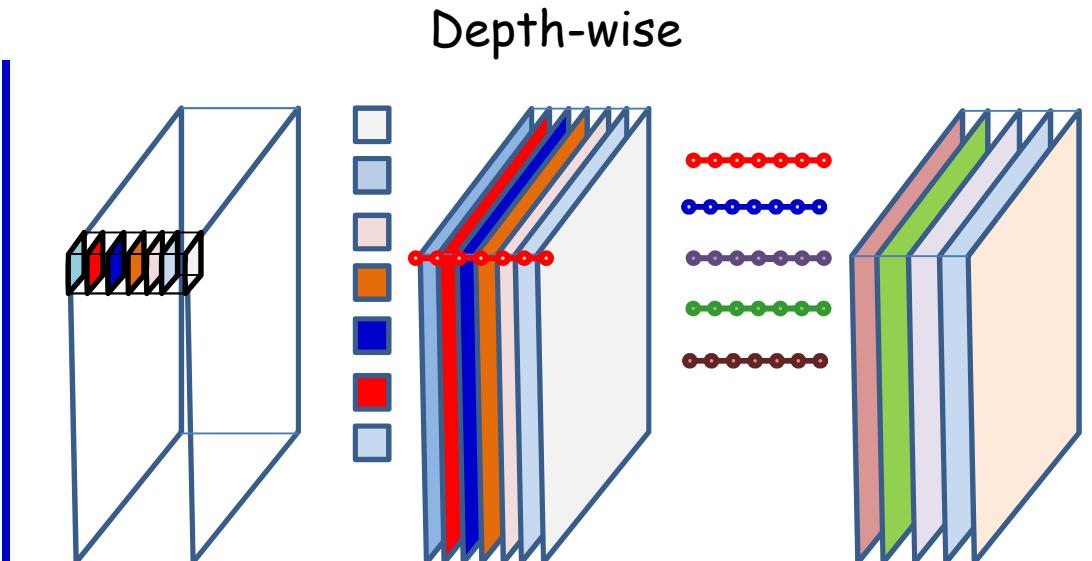

- In *depth-wise convolution* the convolution step is performed only once
- The simple summation is replaced by a *weighted* sum across channels
 - Different weights (for summation) produce different output channels

Conventional vs. depth-wise convolution

- M input channels, N output channels:
- N independent $M \times K \times K$ **3D** filters, which span all M input channels
- Each filter produces one output channel
- Total $N M K^2$ parameters

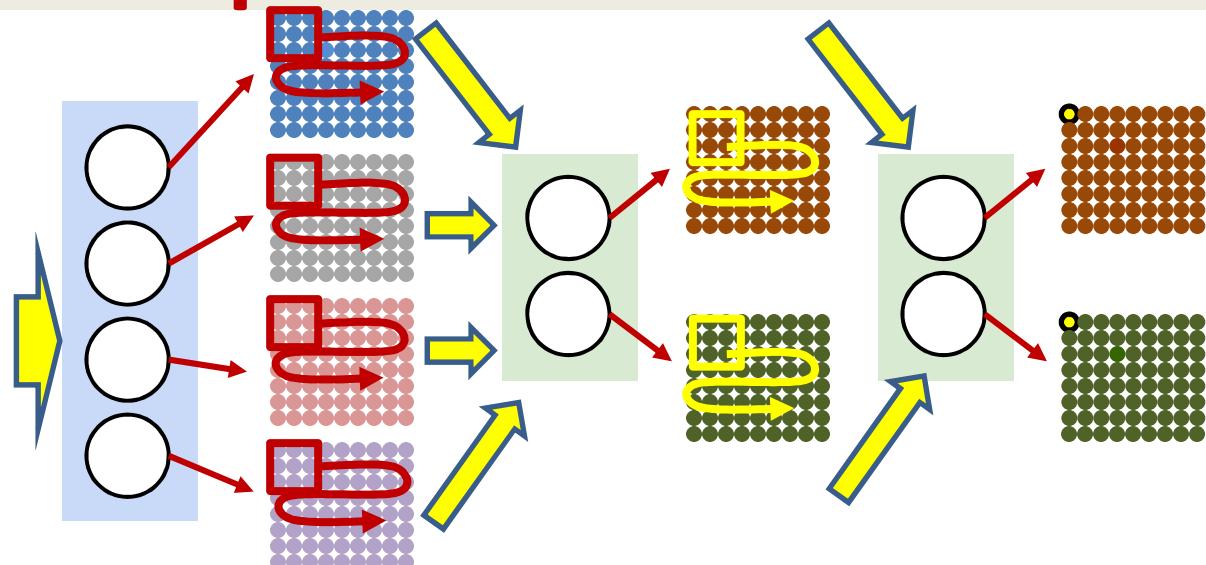

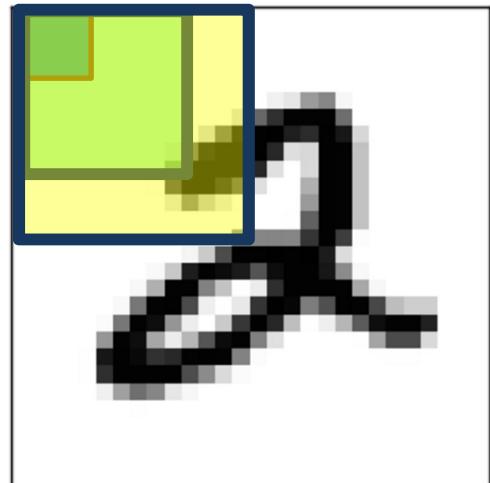

- M input channels, N output channels in 2 stages:
- Stage 1:
 - M independent $K \times K$ **2D** filters, one per input channel
 - Each filter applies to only one input channel
 - No. of output channels = no. of input channels
- Stage 2:
 - N $M \times 1 \times 1$ **1D** filters
 - Each applies to *one* 2D location across all M input channels
- Total $N M + M K^2$ parameters

Story so far

- CNNs are shift-invariant neural-network models for shift-invariant pattern detection
 - Are equivalent to scanning with shared-parameter MLPs with distributed representations
- The parameters of the network can be learned through regular back propagation
- Like a regular MLP, individual layers may either increase or decrease the span of the representation learned
- The models can be easily modified to include invariance to other transforms
 - Although these tend to be computationally painful
- Can also make predictions related to the position and arrangement of target object through multi-task learning
- Several variations on the basic model exist to obtain greater parameter efficiency, better ability to compute derivatives, etc.

What do the filters learn?

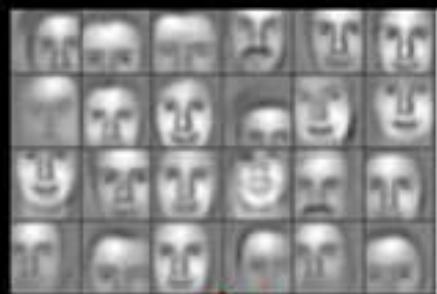

Receptive fields

- The pattern in the *input* image that each neuron sees is its “Receptive Field”
- The receptive field for a first layer neurons is simply its arrangement of weights
- For the higher level neurons, the actual receptive field is not immediately obvious and must be *calculated*
 - What patterns in the input do the neurons actually respond to?
 - We estimate it by setting the output of the neuron to 1, and learning the *input* by backpropagation

Features learned from training on different object classes.

Faces

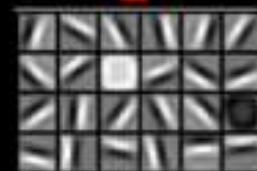

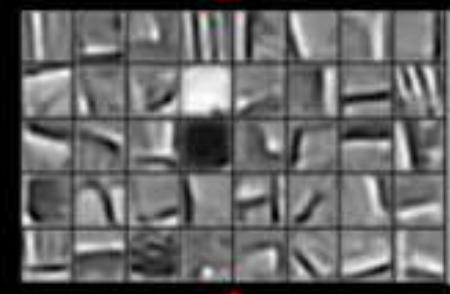

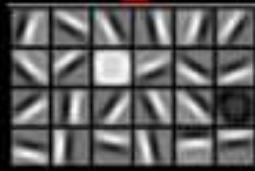

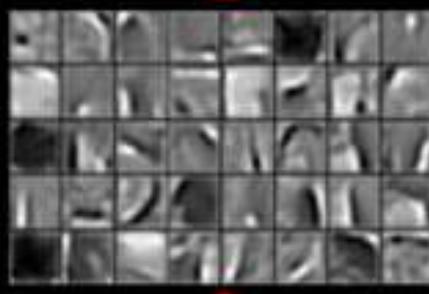

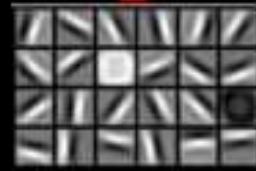

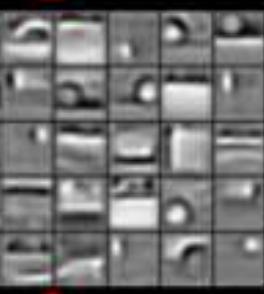

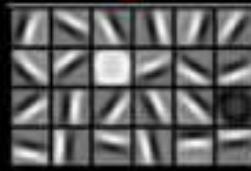

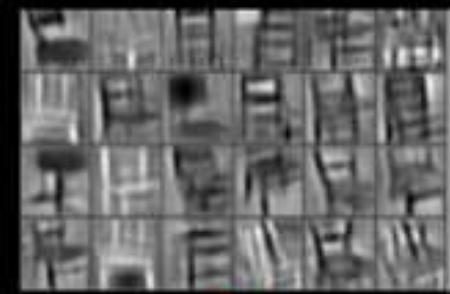

Cars

Elephants

Chairs

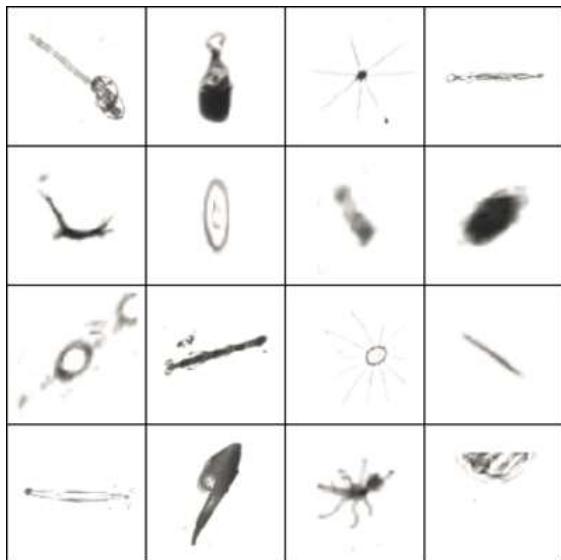

Training Issues

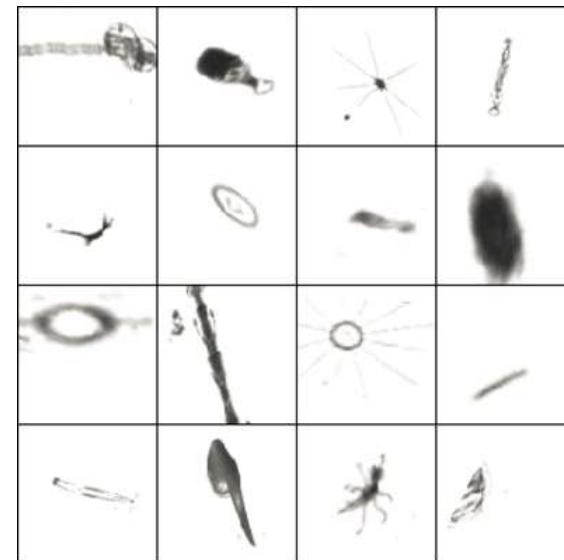

- Standard convergence issues
 - Solution: Adam or other momentum-style algorithms
 - Other tricks such as batch normalization
- The number of parameters can quickly become very large
- Insufficient training data to train well
 - Solution: Data augmentation

Data Augmentation

Original data

Augmented data

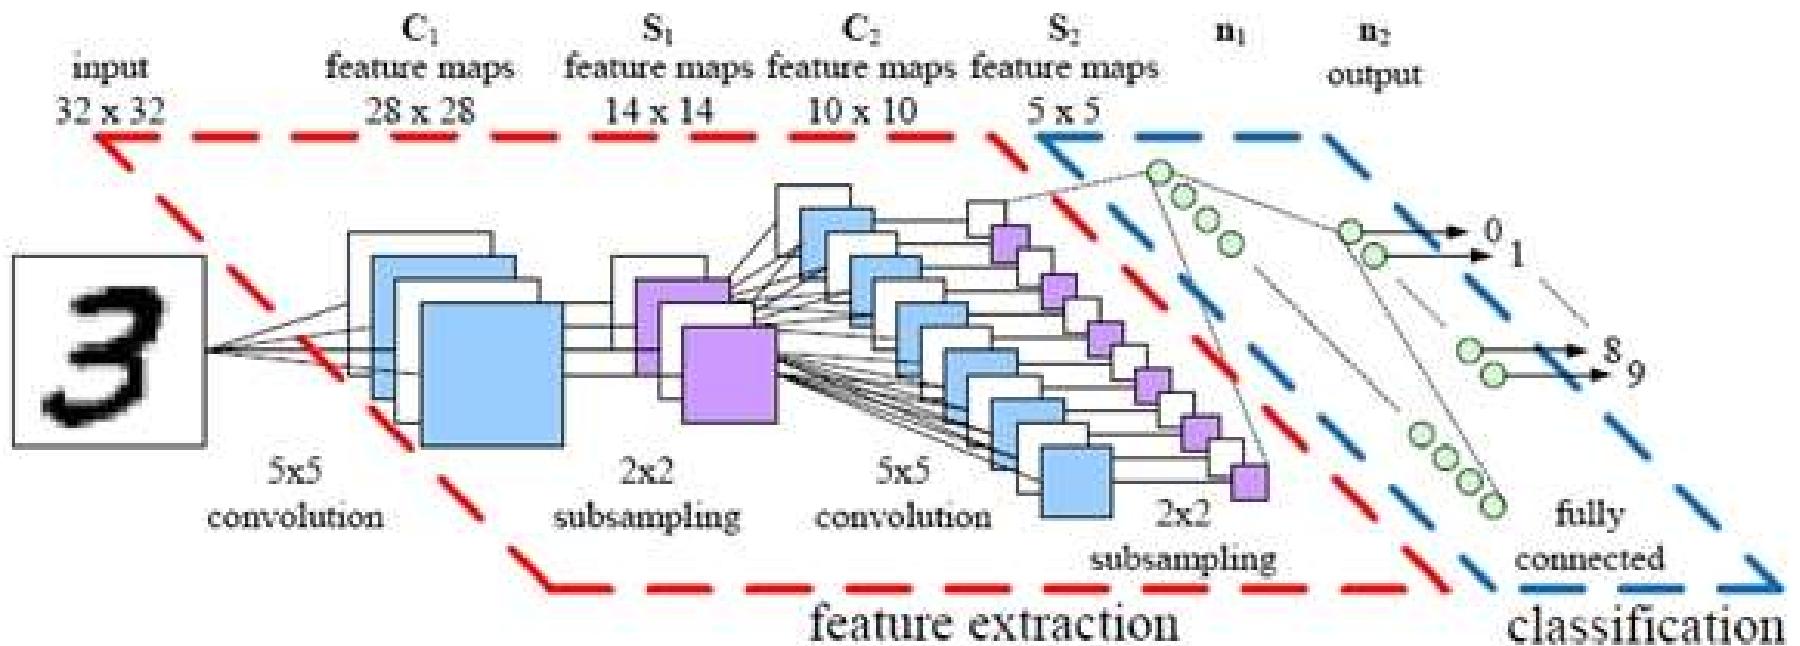

- rotation: uniformly chosen random angle between 0° and 360°
- translation: random translation between -10 and 10 pixels
- rescaling: random scaling with scale factor between 1/1.6 and 1.6 (log-uniform)
- flipping: yes or no (bernoulli)
- shearing: random shearing with angle between -20° and 20°
- stretching: random stretching with stretch factor between 1/1.3 and 1.3 (log-uniform)

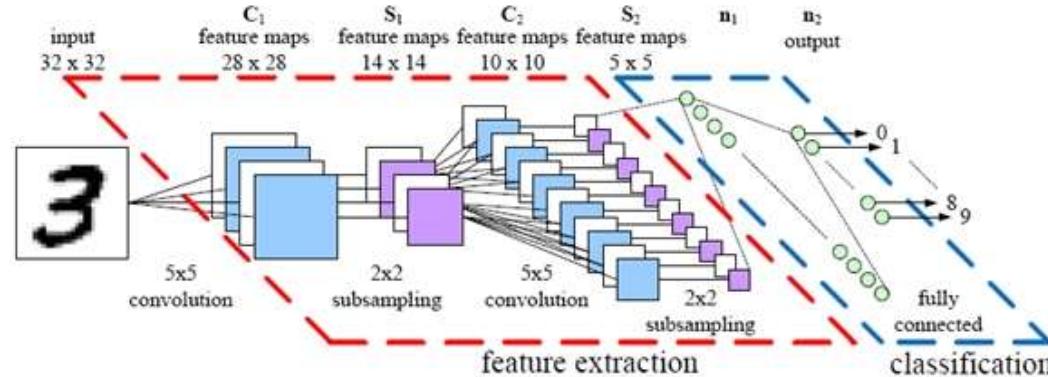

Convolutional neural nets

- One of *the* most frequently used nnet formalism today
- Used *everywhere*
 - Not just for image classification
 - Used in speech and audio processing
 - Convnets on *spectrograms*

Digit classification

Le-net 5

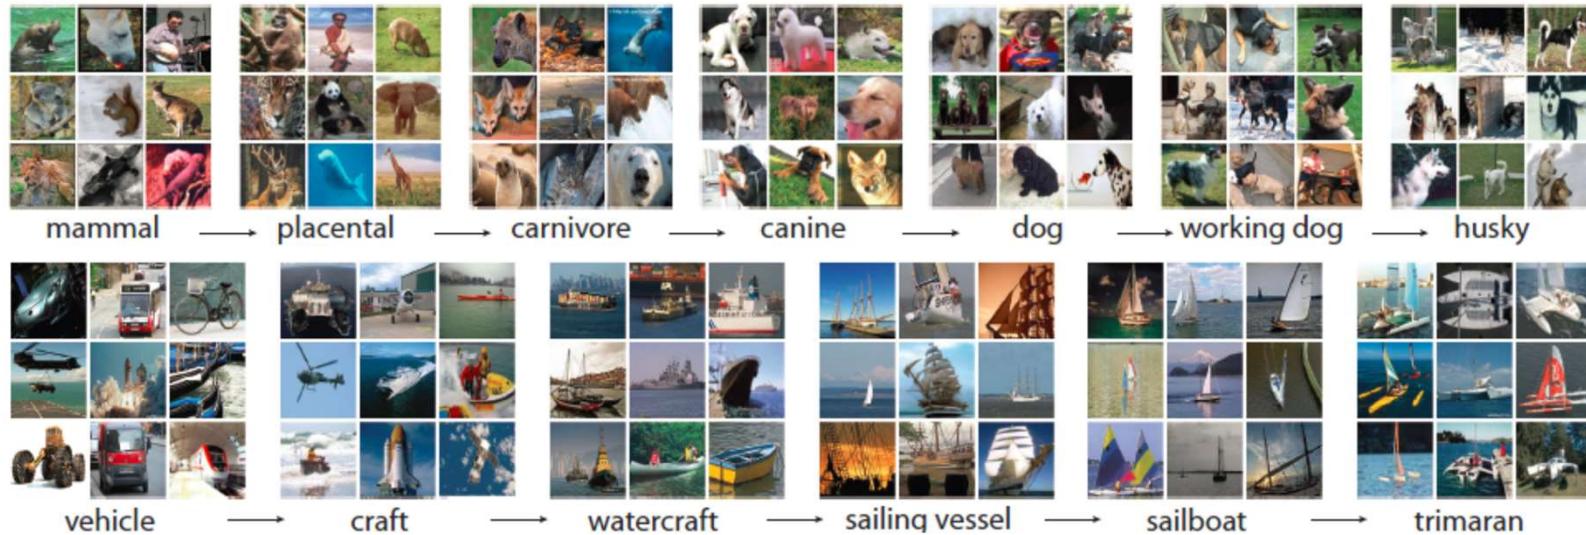

- Digit recognition on MNIST (32x32 images)
 - **Conv1:** 6 5x5 filters in first conv layer (no zero pad), stride 1
 - Result: 6 28x28 maps
 - **Pool1:** 2x2 max pooling, stride 2
 - Result: 6 14x14 maps
 - **Conv2:** 16 5x5 filters in second conv layer, stride 1, no zero pad
 - Result: 16 10x10 maps
 - **Pool2:** 2x2 max pooling with stride 2 for second conv layer
 - Result 16 5x5 maps (400 values in all)
 - **FC:** Final MLP: 3 layers
 - 120 neurons, 84 neurons, and finally 10 output neurons

Nice visual example

- <http://cs.stanford.edu/people/karpathy/convnetjs/demo/cifar10.html>

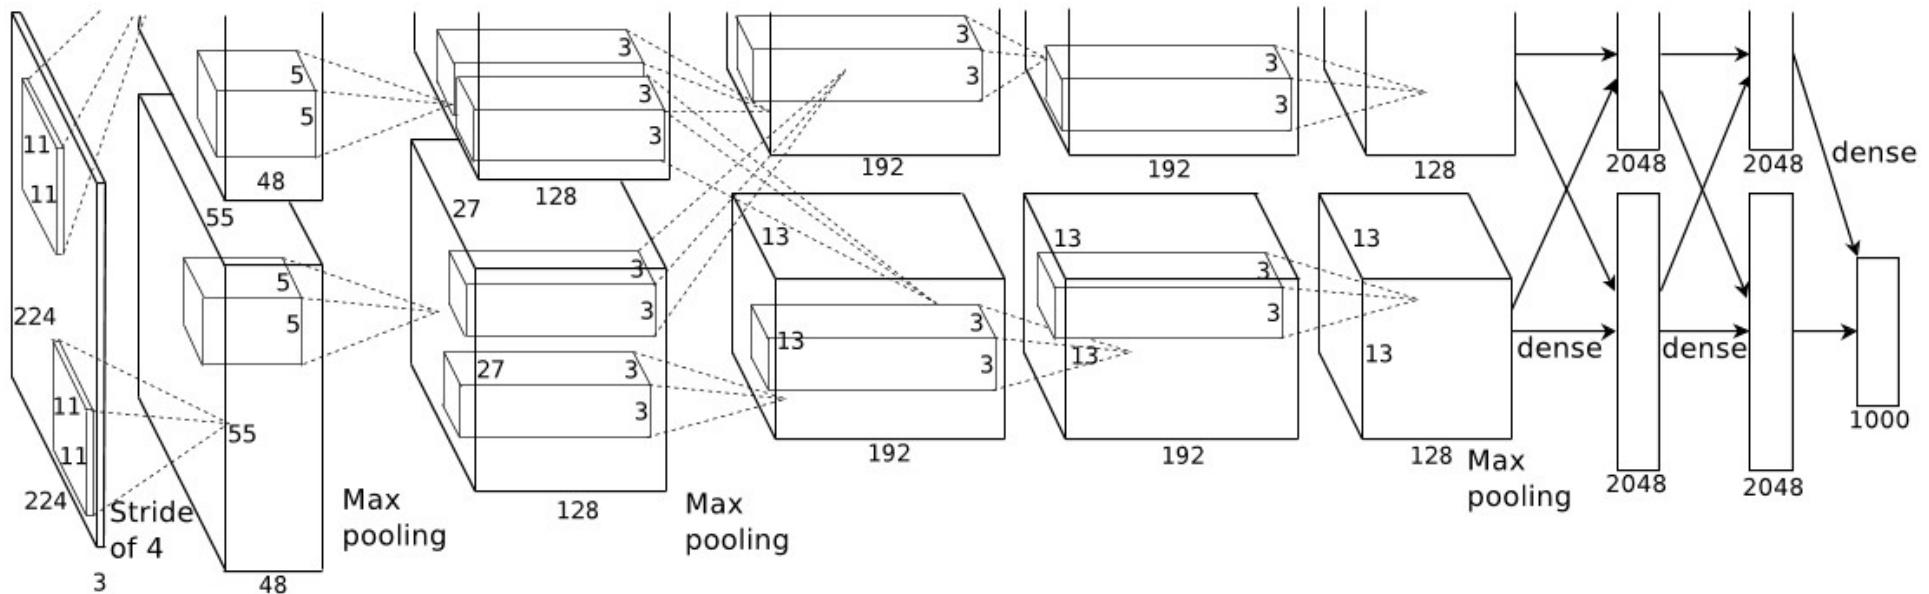

The imangenet task

- **Imagenet Large Scale Visual Recognition Challenge (ILSVRC)**
- <http://www.image-net.org/challenges/LSVRC/>
- Actual dataset: Many million images, thousands of categories
- For the evaluations that follow:
 - 1.2 million pictures
 - 1000 categories

AlexNet

- 1.2 million high-resolution images from ImageNet LSVRC-2010 contest
- 1000 different classes (softmax layer)
- NN configuration
 - NN contains 60 million parameters and 650,000 neurons,
 - 5 convolutional layers, some of which are followed by max-pooling layers
 - 3 fully-connected layers

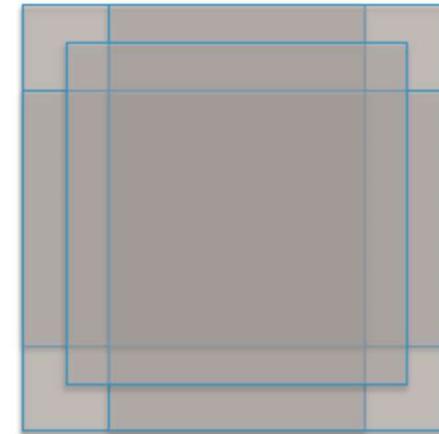

Krizhevsky, A., Sutskever, I. and Hinton, G. E. "ImageNet Classification with Deep Convolutional Neural Networks" NIPS 2012: Neural Information Processing Systems, Lake Tahoe, Nevada

Krizhevsky et. al.

- Input: 227x227x3 images
- Conv1: 96 11x11 filters, stride 4, no zeropad
- Pool1: 3x3 filters, stride 2
- “Normalization” layer [Unnecessary]
- Conv2: 256 5x5 filters, stride 2, zero pad
- Pool2: 3x3, stride 2
- Normalization layer [Unnecessary]
- Conv3: 384 3x3, stride 1, zeropad
- Conv4: 384 3x3, stride 1, zeropad
- Conv5: 256 3x3, stride 1, zeropad
- Pool3: 3x3, stride 2
- FC: 3 layers,
 - 4096 neurons, 4096 neurons, 1000 output neurons

Alexnet: Total parameters

- 650K neurons
- 60M parameters
- 630M connections
- Testing: Multi-crop
 - Classify different shifts of the image and vote over the lot!

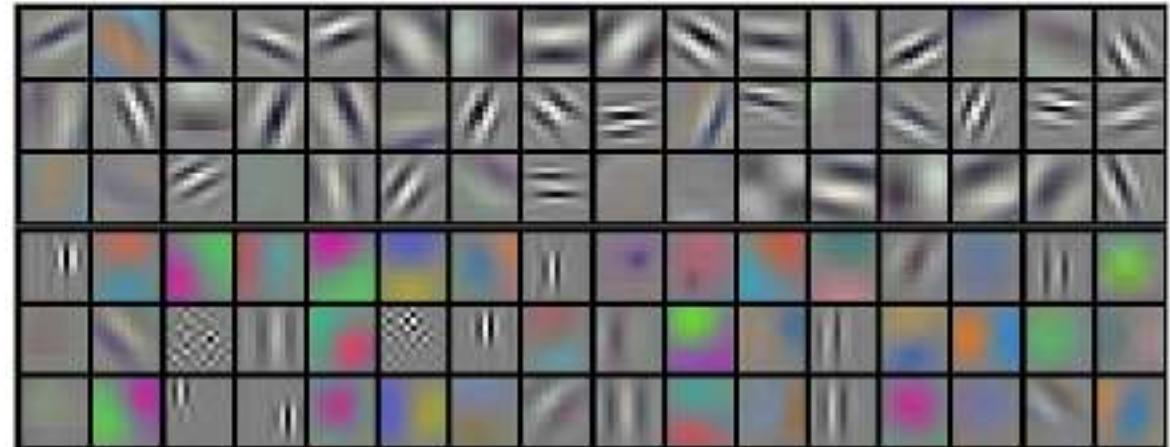

10 patches

Learning magic in Alexnet

- **Activations were RELU**
 - Made a large difference in convergence
- “Dropout” – 0.5 (in FC layers only)
- *Large amount of data augmentation*
- SGD with mini batch size 128
- Momentum, with momentum factor 0.9
- L2 weight decay 5e-4
- Learning rate: 0.01, decreased by 10 every time validation accuracy plateaus
- Evaluated using: Validation accuracy
- **Final top-5 error: 18.2% with a single net, 15.4% using an ensemble of 7 networks**
 - Lowest prior error using conventional classifiers: > 25%

ImageNet

Figure 3: 96 convolutional kernels of size $11 \times 11 \times 3$ learned by the first convolutional layer on the $224 \times 224 \times 3$ input images. The top 48 kernels were learned on GPU 1 while the bottom 48 kernels were learned on GPU 2. See Section 6.1 for details.

Krizhevsky, A., Sutskever, I. and Hinton, G. E. "ImageNet Classification with Deep Convolutional Neural Networks" NIPS 2012: Neural Information Processing Systems, Lake Tahoe, Nevada

The net actually *learns* features!

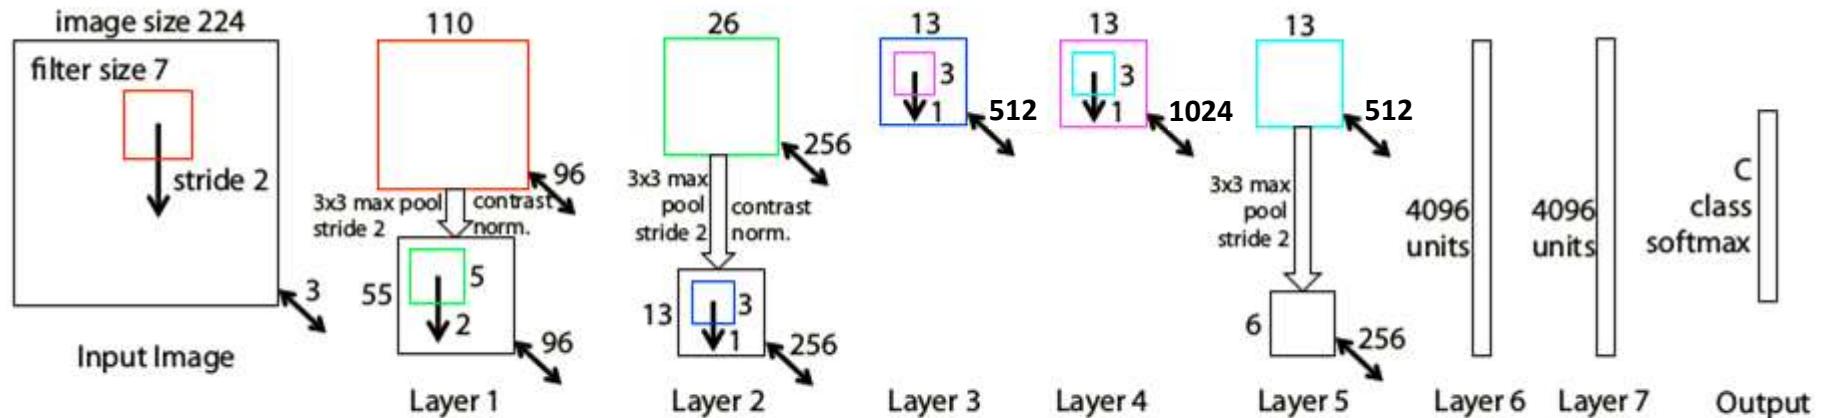

Eight ILSVRC-2010 test images and the five labels considered most probable by our model. The correct label is written under each image, and the probability assigned to the correct label is also shown with a red bar (if it happens to be in the top 5).

Krizhevsky, A., Sutskever, I. and Hinton, G. E. "ImageNet Classification with Deep Convolutional Neural Networks" NIPS 2012: Neural Information Processing Systems, Lake Tahoe, Nevada

Five ILSVRC-2010 test images in the first column. The remaining columns show the six training images that produce feature vectors in the last hidden layer with the smallest Euclidean distance from the feature vector for the test image.

ZFNet

ZF Net Architecture

- Zeiler and Fergus 2013
- Same as Alexnet except:
 - 7x7 input-layer filters with stride 2
 - 3 conv layers are 512, 1024, 512
 - Error went down from 15.4% → 14.8%
 - Combining multiple models as before

VGGNet

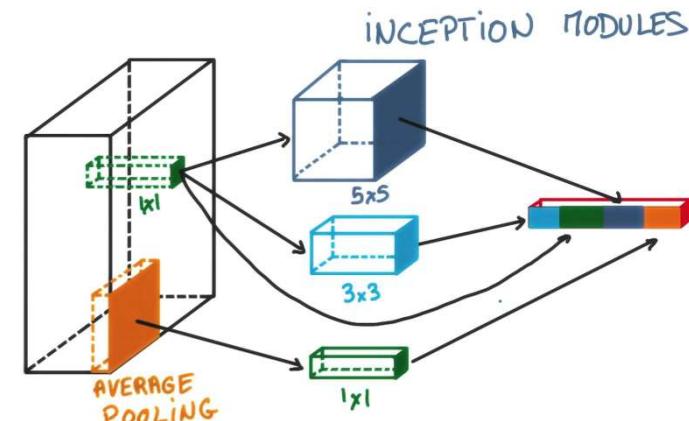

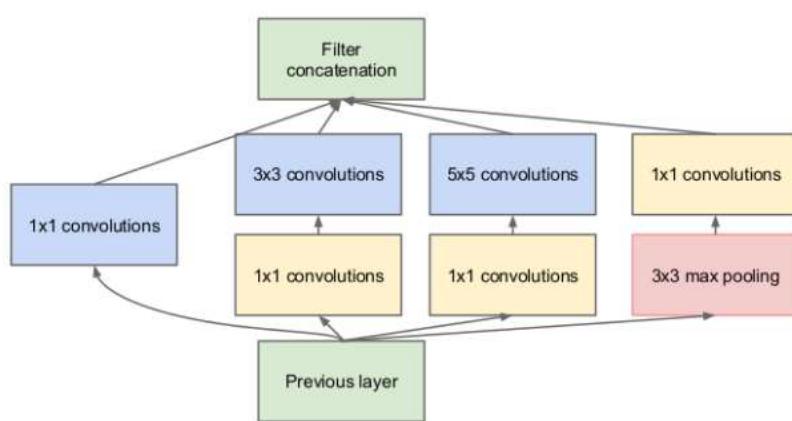

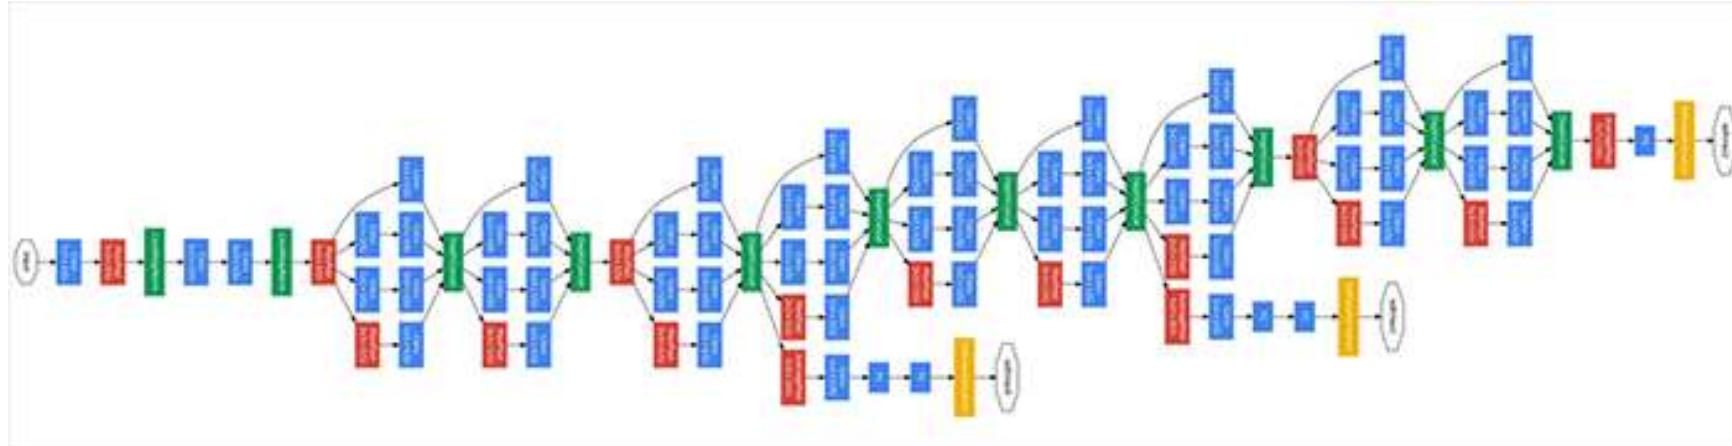

- Simonyan and Zisserman, 2014
- Only used 3x3 filters, stride 1, pad 1
- Only used 2x2 pooling filters, stride 2
- Tried a large number of architectures.
- Finally obtained **7.3% top-5 error** using 13 conv layers and 3 FC layers
 - Combining 7 classifiers
 - Subsequent to paper, reduced error to 6.8% using only two classifiers
- Final arch: 64 conv, 64 conv, 64 pool, 128 conv, 128 conv, 128 pool, 256 conv, 256 conv, 256 conv, 256 pool, 512 conv, 512 conv, 512 conv, 512 pool, 512 conv, 512 conv, 512 conv, 512 pool, FC with 4096, 4096, 1000
- ~140 million parameters in all!

Madness!

Googlenet: Inception

- Multiple filter sizes simultaneously
- Details irrelevant; error → 6.7%
 - Using only 5 million parameters, thanks to average pooling

Imagenet

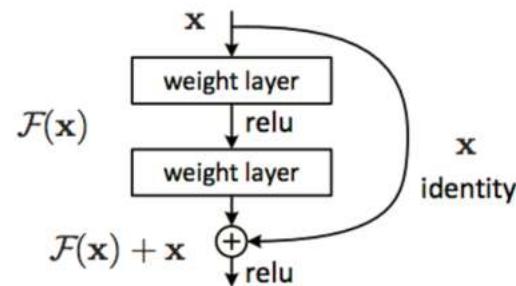

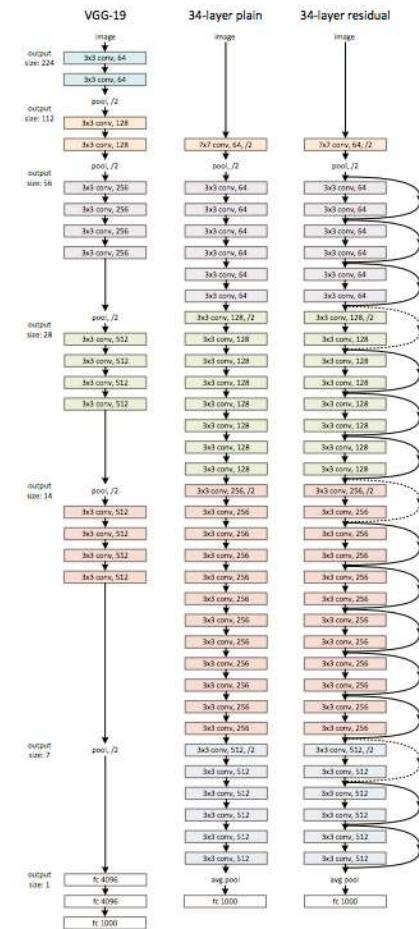

Figure 2. Residual learning: a building block.

- Resnet: 2015
 - Current top-5 error: < 3.5%
 - Over 150 layers, with “skip” connections..

Resnet details for the curious..

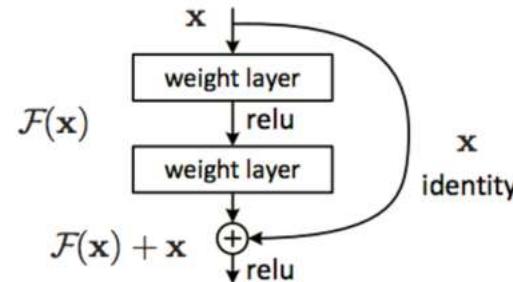

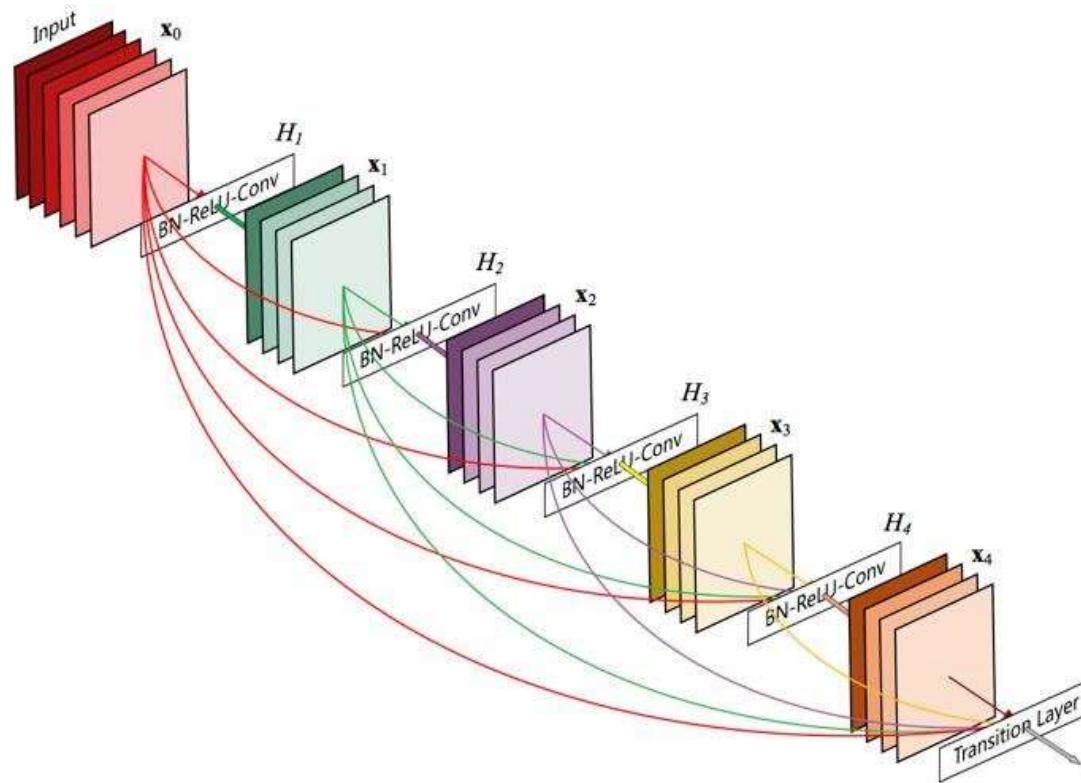

Figure 2. Residual learning: a building block.

- Last layer before addition must have the same number of filters as the input to the module
- Batch normalization after each convolution
- SGD + momentum (0.9)
- Learning rate 0.1, divide by 10 (batch norm lets you use larger learning rate)
- Mini batch 256
- Weight decay 1e-5

Densenet

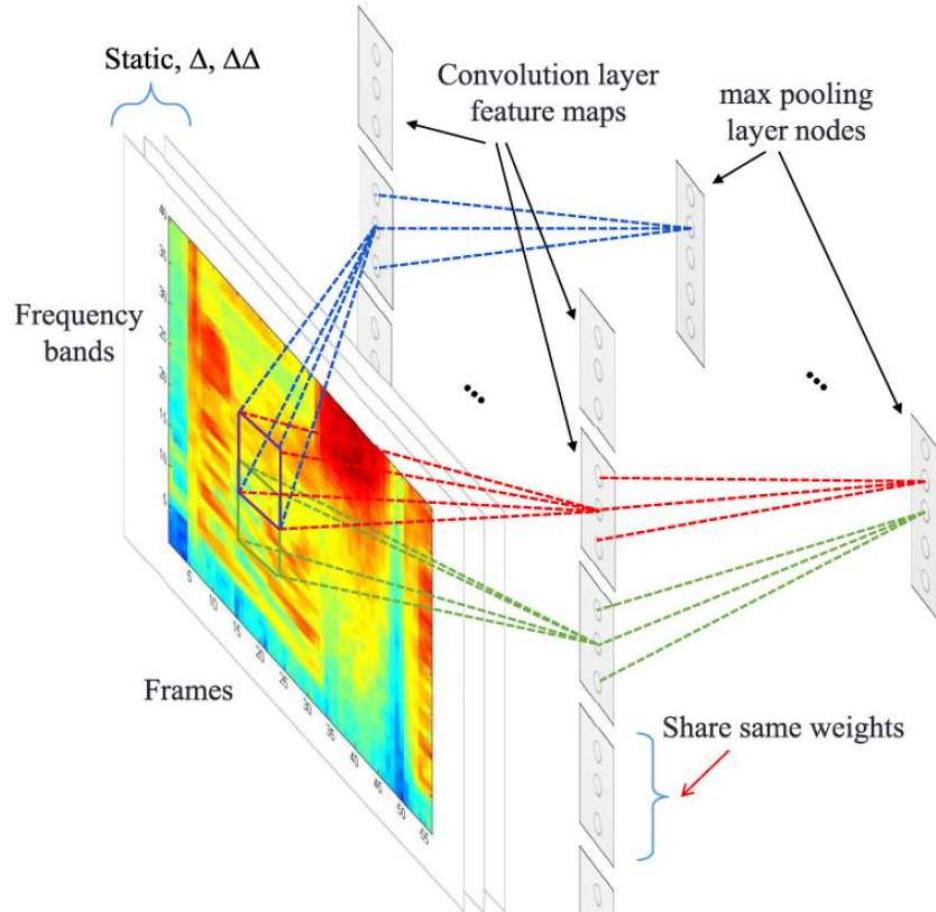

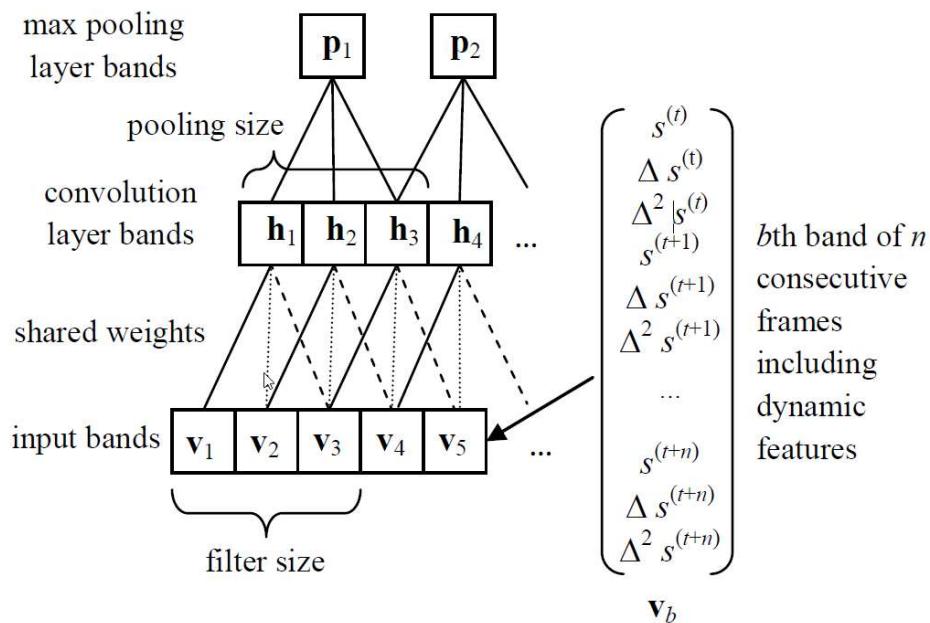

- All convolutional
- Each layer looks at the union of maps from all previous layers
 - Instead of just the set of maps from the immediately previous layer
- Was state of the art before I went for coffee one day
 - Wasn't when I got back..

Many many more architectures

- Daily updates on arxiv..
- Many more applications
 - CNNs for speech recognition
 - CNNs for language processing!
 - More on these later..

CNN for Automatic Speech Recognition

- Convolution over frequencies
- Convolution over time

Deep Networks	Phone Error Rate
DNN (fully connected)	22.3%
CNN-DNN; P=1	21.8%
CNN-DNN; P=12	20.8%
CNN-DNN; P=6 (fixed P, optimal)	20.4%
CNN-DNN; P=6 (add dropout)	19.9%
CNN-DNN; P=1:m (HP, m=12)	19.3%
CNN-DNN; above (add dropout)	18.7%

Table 1: TIMIT core test set phone recognition error rate comparisons.

CNN-Recap

- Neural network with specialized connectivity structure
- Feed-forward:
 - Convolve input
 - Non-linearity (rectified linear)
 - Pooling (local max)
- Supervised training
- Train convolutional filters by back-propagating error
- Convolution over time
